Well, I guess the only ppl to have this is some of the Atari old timers!
I supprised though that the newer versions aren't backward compatible with
v3.

Well, than you have never used a real good BASIC interpreter/compiler.
A lot of "old" Business BASIC versions are not much different than
more modern HLL. And even the BASIC used in machines like
Amstrad/Scneider or the good old BBC were a different ball game too.
Not to mention HP "Rocky Mountain BASIC" for technical apps....
Don't just think the crappy C64 basic or stuff like this... ;-)))

```

below what i mentioned from a general wholesales web site above.
>costs and the basic essentials (special casing (not just a standard box),
>cooling, cables etc...). These things eat into margins.
Well, not much cables in a modern computer, ok add another $2 and
maybe $5 for keyboard and mouse. As for materials to build it, you are
still way below $100.

There will be additional overhead, like labor, shipping and
advertising, for which i would assume even more money than the actual
labor to build it.

But the biggest catch would be to get the start with several million $
financed first, without knowing IF such a product would actually
sell...
Well, i don't have that much money to gamble with, and if i would, i
would rather lay somewhere the the tropical sun than writeing these
lines ;-)))

> too. I don't know whether the combination with TOS 1.02 could be
> the problem? And what do you mean by 'setting of'?

I won't comment on the TOS issue because I don't know, but are you
really sure that GDOS is set up properly? CAB uses the fonts it is
pointed to in the OPTIONS\FONTS menu. The fonts used in GDOS are
different for medium and high res (a different width to height ratio).
The font names for each will be named differently in ASSIGN.SYS if
they aren't the system font. Check if the font names in CAB match
those set in ASSIGN.SYS and also check that they actually exist in the
GEMSYS directory specified in ASSIGN.SYS.

Note also, you won't necessarily have the same font sizes in Medium
res as you do in High res. This may be the reason for differing
appearances when displayed in CAB.

Hi Andrew,
The easiest way to do this on CiX is to upload the files from the
Falcon to your personal CiX file area and download them back down on
your PC. Unless the files are unreasonably large, or the Falcon isn't
online any more, this would be the most painless way ISTM B^)

Hi Neil,

>I intend daisychaining the scanner with my other new purchase (a Yamaha
>CDRW 16x10x40) presumably I can still do this?
Yes, I have a matching setup here (Yamaha 8824 & Epson 1240).

>thought I read somewhere that a scanner and a CDROM drive cannot both be
>"live" on a chain.
Don't believe a word of it....

>The CDRW is ID6, GT9500 is ID5 and the Falcon CT2B is ID7 - which one
>needs to be terminated?
In the above setup, you should terminate the CDRW.
May I suggest to switch the ID's around? I used to have a Epson 9500 and
noticed that it likes to be the last one in the chain, the Epson 1240 also
like to be the last one in the chain... don't ask me why, I don't have a
clue...

Cheers from Belgium

>How many people here use ZIP.TTP ?

Directly: Very very seldom, only when 2-in-1 calling ZIPJR.TTP fails.

>How many people here use it in conjuction with a GEM-shell and why?

2-in-1 is most useful and flexible - takes all the hard work out
of passing parameters. In addition it offers the choice of most
of the common unpaackers, not just ZIP.

There are times when a command line is not too bad - in Suji, for
instance, you can use it to restrict the search to certain drives
or directories, though you can also do that in the following GEM
dialog after 'folding out' the bottom half. The command line is
faster and easier for drive-only selection, while I use the
dialog/fileselector for deeper nested paths.

Regards, /Peter/

It might be a colour cpx.

I remember when I got my TT a few weeks that I unintentionally made fore and background colour the same. I thought I ruined the TT. (10 years ago :-)

After rebooting without HD I was able to conclude that the colour cpx set the palette when it is activated at start up.

So I refreshed the cpx from the installation disc and that cured it.

Thing should work fine with the default palette.

Actually I think it may already have been done. A group of scientists in
India have developed the prototype for a $300 computer for the masses.
Although recently a separate story proposed for India modern playstation 2
or Xbox as the basis for such a computer.
I think the current Shift magazine mentions the cheap computer prototype.
No idea what its features are.

Hi Janez,

First of all, please read my reply again. For some reason you seem to think
I'm having a bash at MiNT users...

>>*Most* of the STIK/STiNG clients are inferior to the IConnect clients,
>>prove me wrong if you like... IMO except for Okami there is nothing out
>>there that even comes close. Like I said: why settle for second best?
>Realy? Atack FTP is great app, so is Atari IRC, both are free, what
>about those nice internet games from Mario? And again, there is NO
>absolute best app, someone like one, other ppl different app..
I didn't say that they these apps aren't nice or are rubbish. I said they
were inferior to the IConnect clients...
The two named programs can't compete feature wise with Fiffi and Chatter,
you may argue that you don't need all the features... fine. The IConnect
clients all have the same look and feel, are optimised to work together and
use the MagiC AES to it's full potential and in addition they are also
GemScript clients... and yes they are commercial, so what?
More and more I get the impression that in this newsgroup liking commercial
software isn't appreciated...

>> I can't recall the last time I needed SSL, i can seem to do without...
>
>Well u see, SSL Lynx (crapy cli app) does very good job on banking
>accouns, ebay payment pages etc.. My point was, how can be IConnect so
>superior but dont offer SSL, real local network, etherent cards supportm
>NFS.. to mention some? Again, i dot say its crap or bad, but dont think
>its something unseen...
I know what your point is...
SSL has got nothing to do with IConnect, it's an overlay for CAB. I don't
know the exact details but Sven Kopacz once wrote me that adding SSL to the
original CAB.OVL couldn't be done because the encryption is protected by US
law and may not be exported and implemented without permission and obtaining
that permission would take years... ASH should be crazy to release such an
overlay... (which makes me wonder about the legal status of the MinTnet SSL)
The concept of IConnect is to offer an easy and reliable dialup connection
on stand-alone computers, nothing more nothing less. Time and time again the
argument is used that IConnect can't handle local network etc... it doesn't
have to, since it hasn't been programmed for that purpose. Is this really so
difficult to grasp? BTW: are you 100% sure that IConnect isn't capable of
adressing local networks ? Sven once tossed a few suggestions my way about
editing the files in the ETC folder.... all that's needed is a driver to

adress the ethernet card and before you know it....

>> Just give me *one* example of a ported Unix program that runs on a 68030
>> with acceptable speed, offers more features then its GEM counterpart and
>> is programmed with the Atari protocols in mind... AV, DHST, BubbleGEM,
>> xFSL, GEMScript, iconify etc... i call anything less second best.
>
>I sure cant do that.. Why would Unix apps bare in mind specific Atari
>protocols?
Because they run on a Atari damn it... it took years before the mainstream
programmers agreed upon and implemented the above mentioned protocols. These
ported Unix apps teleport us back to the late eighties, Sorry Janez, but
I've been spoilt in the mean time...

>>Lets put it this way: if someone wants to run applications the way you
>>suggest, he can install MiNT and go ahead. There's absolutely no need to
>>waist valuable time trying to achieve the same thing under MagiC. I can't
>>imagine many MagiC users waiting for this to happen either.
>
>I can, and i know few.. Its not strange and odd for me that ppl like
>Magic, and also wish some stuff from MiNT, and just to remind u, new
>version of Magic announced, DOES have improved MiNT compatibility..
>
You didn't get my point... everything you're talking about can be achieved
under MiNT, so what's the problem?
I can switch between TOS, MagiC and MiNT whenever I like. If I need to run
an application that needs MiNT then I boot up MiNT. I really can't see one
reason why someone would need to waist his/her precious time porting that
application so it could be run under MagiC.
Every new version of MagiC contained a lot of adaptations to make it more
compatible with MiNT... if the MiNT developers would have gone through the
same trouble we might have had at this point in time two more compatible and
better OS's... the improved MiNT compatibility is at GEMDOS level, so don't
get your hopes up to high...

>> BTW: If i feel the need to type commands i'll dust off the Atari 800...
>Yeah, u realy know CLI.. and its advantages...
OK, it wasn't a good example...
Let's say I don't wanna start typing and memorising meaningless commands all
over again, just for the sake of it.

>> How many people here use ZIP.TTP ?
>> How many people here use it in conjuction with a GEM-shell and why?
>
>I use it. However the Unix version, because standard STZIP craps with
>minixfs and ext2fs. The shell aint aware of NFS (well no prb for
>u) etc.. It is a messy shell, u could tooke better example. But to ask u a
>question: how smart u must be to type < unzip filename >
I know I could have used a better example, but I specifically took this one
because nearly everyone here uses it...
True...one doesn't have to be very smart to type <unzip filename>, but where

will the unpacked archive end up? Suppose it contains 100 files and a couple of folders... what if I only need three files which are nested in folders three levels down from that archive? One doesn't need to have a master degree but let me assure you that a couple of mouse clicks to achieve the same thing is *much easier*.
Does the word "user friendly" means anything to you? someone new to this platform will be able to use the shell within a few minutes... one of the reasons the Atari became a huge success was because its user friendly GUI and applications, TTP's are the opposite of user friendly...
Sometimes I wonder if the people that port these programs come from the same planet... they obviously must love this platform to go through all that trouble, is it really that difficult to add a GEM based shell? it doesn't need to be anything flashy, just functional. Some docs in STG or UDO format compiled as a HYP file would also be a great help...

>Please explain what "u and your bunch" means... I mean i understand
>sharing views and ideas, defending them, this looks like calling names. U
>as Magic lower on one side and, we bunch, who use other idiotic oses on
>other?
Explanation: I have no idea who Frederic Fouche is, he replied to me "we'll make sure that the next version can not run on any of those"... so I assume he's a member of a programmers team...
And please don't turn this into a OS-War... I didn't mention MiNT in any way, neither did I compare MiNT users with idiots. Why are you so sensitive about this? can't you accept the simple fact that for someone using his computer as a stand-alone unit network capabilities are of no use?

>Im happy to be "idiot" who waist time on this "gone to the dogs" platform
I wasn't aware you were a commercial developer, you wouldn't be interested I suppose to develop that new browser? :-/

>>now, occasionally someone pops up here wanting to know how to set up the
>>demo version of CAB with STIK/STiNG, people aren't even prepared to pay
>>for CAB anymore... this platform has really gone to the dogs!
>So why are u here then? I dont think this platform needs persons like u
>giving such commentars...
Thanks for your opinion... I'm sorry now that I didn't react a couple of weeks ago to your "commentars" about the proposed new clones. A group of people here "despise" ASH so much that they even *steal* their software, if you honestly feel my comments are out of order fine, I'll just put a sock in it and shut up.

Cheers from Belgium
Dennis

FA: Atari STacy Laptop 4mb RAM 130mb HD, MIDI Software pre-installed

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1255558306

A classic Atari computer: has been upgraded to 4mb of RAM and has a 130mb internal SCSI hard drive. Keyboard mylar was recently replaced with OEM part from Best Electronics.

Amazing tool for MIDI production! Scroll down to take a look at all the midi software that comes with this stacy. This STacy has *NEVER* crashed in the 6 years that I've owned it, and the MIDI timing is proven to be more solid than 99.9% of PC's. This is thanks to the custom built in midi hardware:

Case has a few scratches and a couple of chips but everything works perfectly. Cosmetically 6.5/10, 100% functional.

The screen still lights up (as you can see from the pictures). It's missing a couple of plastic covers but this doesn't affect operation.

BONUS!! Power supply has been mounted internally so that you don't need to lug around an external adapter. This STacy now takes regular PC power cord which is included here.

(I really don't want to part with it but alas, I'm saving up to buy some new studio equipment)

Software Included:

Midi Sequencers

-Dr. T's KCS Omega Sequencer 4.0
-Master Tracks Pro 3.6
-Cubase 3.1 (Doesn't need a dongle)
-Hybrid Arts Edit Track Platinum 7.1
-Intelligent Music "M" Interactive Composing System
-Electronic Cow Midi Arpeggiator

Algorithmic Composers

-Electronic Cow Charming Chaos
-Intelligent Music Realtime Algorithmic Sequencing
-The Groove Analogue Sequencer Simulator
-KCS Tiger Cub

Synths and Sample Players/Processors

-Electronic Cow Scribble Additive Synth
-Electronic Cow EC-909 Drum Machine
-Electronic Cow Snippit Granular Synth
-Electronic Cow Squashit Sample Processor
-Electronic Cow Sound Chip Synth

Utilities

-NVDI 5.0
-HDDriver 7.8

Operating Systems

-Magic 6.1

SPECIFICATIONS
CPU: Motorola 68HC000 @ 8Mhz

I, not a company or else, can by a 700mhz AMD processor for 24$.
That doesn't seem 'far too expensive' to me. Those processor rocks!

> As OS? (Linux is a dead giveaway, but there also other OS's out there)

Linux, why not. .. oh yea. You mentioned userfriendly. so thats a nono.

> Build in programming language? (please choose anything but Basic!)

Built in? Are you think stuff like in the 70's? Or you really want to put a C++ compiler in rom?!?!?

FA: Atari SM124 Monochrome Monitor - NO RESERVE

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1255614522

Atari SM124 Monochrome Monitor - NO RESERVE
This is an original factory Atari monochrome monitor, manufactured by Goldstar for Atari. Supports the Atari Hi-Res standard of 640 x 400. Great for working on Atari apps like word-processors and midi sequencers.

It has a built in speaker, volume control, brightness control, and contrast control. It's in perfect shape and the screen has no discoloration at all:

The monitor has a standard 3-prong power connector and the power cable is included. The cable to connect to the computer is built-in and is in good condition (no bent pins).

So you don't want to hear the truth on how the Atari market looks like.
Instead you prefer to belive in (as Dennis correctly explained) in
vapourware like machines with non-existing processors instead of
software that is obviously still supported. That's digging one's own
grave.

So why don't you buy an Amiga then? I'm serious with this question. You
say the Hades is too expensive and the software you want is running on
the Amiga.

Well I'm owed three mags.

I contacted Paul Glover about 8 months ago to let him know my new
address and he replied syaing that the second issue of the mag was
almost ready to go!

Since then absolute zilch.

Not a very good situation.

:-(

Best wishes
Mike Kerslake

Personally I'd like to go for £400 to allow for inflation (my a1200 cost me £330 in 94'), but for the sake of arguement I'll stick to the 300.
OS: QNX other than NASA no body seems to have picked it up as a serous concern, so they maybe more acceptive as a partner in the project.
Proccessor: Probebly a Strong ARM or similiar, they seem very light weight and shouldn't cause over heating, either that or a Hitachi proccessor 1 step up from that of the dreamcast should be ok.
Graphics: I'll got out on limb here and say the ati128 as it is happy in both TV and monitor setups.
Sound etc: a cheap media proccessor, allows plenty of playing about by hobbyists so should be good enough.
Media/storage: some sort of CDrom and a 4 to 8 gig HD depending on whats cheapist.
Memorey: probebly ddr as its not that much more expensive than standard sdram and I'm not convinced that sdram will be around for much longer. Also allows better perfomance for the graphics and media.
ports: 4 usb, 1 network connection
Ideally you want all this on one mircoatx compatible board in a dvd/vcr style box, this way you can refit it in a tower case if you so wish.
keyboard and mouse.
no tv or monitor, buy your own you cheap skate I had to in 94' why should I give you one now :P

> So why don't you buy an Amiga then? I'm serious with this question. You
> say the Hades is too expensive and the software you want is running on
> the Amiga.

Lonny did not say that.. He said that its not true noone wants Hades/Milan (he has Hades, we have Milan), he said its not cheap so ppl dont affordit widely, but machines still sells. And about Amiga: he statet that he seen Java working on Amiga 030 (50mhz ACC) as so there is NO reason it couldnt be done on 030/040/060 Ataris.. U on other hand, efectively bash and spit on any attempt of even talking about new projects, or simple poll.. So id rather ask u, why are u still here, on dead platform (your words, not mine). And also as we speak, some preety serious software is developing, big project, also good "accepted" by press (test version)..

Believe me, we know dead well where Atari is today, how alive is, and we dont dream about some ressurection.. But we DO love this platform, and noone cant stop us talking about it.. And u may deny all that, call use idiots, dreamers, explain for any projects how stupid and impossible is to do it.. without dreamers and ppl who arent, as u say for yourself, realistic, most inventions wouldnt be done.. Wright brothers were bashed and calling names, but hey, planes today reach mach3 and fly high and long!

Last world: in 800XL scene, same ppl (say stupid, dreamers, off reality) did preemptive mtasking os, scsi drivers, RAM expansions, accelerators.. Iwe seen such machines, all i can say is, im amazed, i respect those guys a LOT! And as we speak, rumours says HTML parser IS developing for XL.. (and before u start laughing: im sure its better and faster as todays big hit, WAP ;)

>of the common unpaackers, not just ZIP.

Although 2-in-1 is arguably the easiest (un)packer shell, it won't handle long file names. Look instead at ARCview or the (un)packer Scripter scripts supplied with jinnee. I will say that ARCView is a work that needs completion however, as the last version I downloaded could only add files to a previously existing archive (unpacking is fine).

It is pretty obvious that having an open mind towards new projects (both hardware and software) is not preventing anyone from supporting existing software, but that is clearly not the issue here. Why is it so damn important to you to discredit projects you don't believe in yourself? Of course there are projects that I too might think has less chances than others, but I leave it up to them to prove me wrong. I won't turn into a prophet of doom...

We all know things are not looking good for the atari platform, that is true and noone is denying that. But is it better to burst all energy into preaching what can't be done and what will fail, instead of supporting the efforts that are made? As for the browser talk, it will be no easy task to fulfill such a project but I wish anyone taking on that mission all the best.

I don't know about others, but I'd rather be a dreamer with some hope left, than putting my efforts into trying to convince people nothing can't be done. As stated before, you are entitled to your opinion, just remember that an opinion is not automatically the truth. Even if it is yours.

/Joakim

Not at all. I believe his report about Droconis not working
as advertised, he had it in his hand it don't work.
That's a valid complaint. What I don't understand is why people
such as yourself prefer to not move forward at all, it's as if you
prefer to see things fail. I do not believe each and every
thing I hear, if it shows fine, if it don't fine. But why
beat things down before they even get of the ground?
Should a developer look here they will start to think why
bother... I don't see such discussions helping matters at
all.

I don't question why it is expensive, I KNOW IT IS. duh...
I said it's not a software issue that keeps it from selling.

> > It's a price issue, always has been. You hit the right price and it

Because every Amiga at the same clock speed is slower, infact
I seen an 060 amiga, utterly not impressed. So to get any
speed you have to fork out over 1200 USD for ppc board, which
has little if any real software, and some serious bus speed
limitaiton. Plus amiga os is butt ugly and I never really
liked it.

Why don't you get one? You are so unhappy...

I seem to recall that on installation of CAB a suitable resource file is
installed, did you select an appropriate resource file for CAB when you
changed mono/colour?.

You people are insane.
for $300 you can get a high end pentium 3 system, loaded.
for $100 more you can get a high end 1.4gig system, loaded.
and these are retail prices! that doesn't include monitor, but who
cares?

get with the times.

I don't think so. Maybe for around $600 you could
do that. What world do you come from anyway. The
gigahertz processors cost over $1000 in the store in
a built system. The processor alone would cost a couple
hundred retail.

I've had money 'STOLEN' by this crew, cheque was cashed, no goods or
explanation supplied..

I took the conscience dig that they were in trouble and re-subscribed, after
I'd previously dropped my sub due to its drop in standard and content. I
sent a cheque and received nothing. I know of 2 other persons who've also
suffered 'theft' at the hands of STCLUB but I'll leave it to them to decide
if they step forward.

I had a friend watch a message he forwarded to the purveyor, he confirmed
that it was 'collected', amongst others. (CIX apparently allows monitoring
of delivery of messages). So much for the guarantee.

FTP site of Ghostscript:

ftp://lifshitz.ph.utexas.edu/pub/atari/ghostscript
ftp://atari.archive.umich.edu/atari/Gnustuff/Tos/Ghostscript
ftp://src.doc.ic.ac.uk/packages/atari/umich/Gnustuff/Tos/Ghostscript
ftp://info2.rus.uni-stuttgart.de:/afs/umich.edu/group/itd/archive/atari/Gnus
tuff/Tos/Ghostscript

Ghostscript 3.12:

gs312b.zoo - The Atari 68000 executable for Ghostscript 3.12 and the minimum
array of support files and fonts required for Ghostscript to work properly.
Everyone who uses Ghostscript needs this archive.

gs312s.zoo - Atari-specific source code for Ghostscript 3.12. You will need
this file if you want to modify and recompile Ghostscript, or if you want to
compile it with different compiler flags or for different machines. You will
also need to obtain the remainder of the source code from a gnu distribution
site. Be aware that it is a major effort to compile Ghostscript on Atari
machines unless you already have an extremely reliable unix-like
(multitasking) setup. In any case, a good deal of time and disk space are
required.

ps_picts.zoo - This is an archive containing some PostScript programs which
can be displayed and printed using Ghostscript.

Older Versions of GS:

Ghostscript 3.12 has not yet been compiled for 68030/68881 machines (at
least that I am aware of). The following older versions may still be found
on Lifshitz:

gs020881.zoo - This contains an executable of GS 2.61 compiled for the 68030
and the 68881 coprocessor, intended for the TT. This executable needs the
support files in the gs261b.zoo archive. It will not run on machines which

do not have a coprocessor.

gs68020.zoo - This is an executable of 2.61 for 68030 machines without coprocessors, namely, most Falcons. It requires the support files in gs261b.zoo.

gs68881.zoo - This executable of 2.61 supports 68000 machines with 68881 coprocessors. This should include upgraded ST, and STE machines. The support files from gs261b.zoo are required to use this program.

gs301bt1.zoo - 68000 beta executable for GS 3.01 along with some ASCII and PostScript help files. The start-up PostScript support files are compiled into this version, so you don't need those. Three fonts (Courier, Times-Roman, and Charter-Italic) are also compiled into the executable.

timetest.txt - Some benchmark tests for Ghostscript 2.61 on various Atari machines.

GemGS:

gemgs13.zoo - Source and executables for a GEM shell for Atari Ghostscript. Many of the features of GemGS have now been incorporated into Ghostscript itself, but some people may still find GemGS useful. Version 1.3 was written for Ghostscript 2.5, which could not yet redirect text I/O to a window. For this reason, GemGS forcibly suppresses most text I/O when "Windows" is selected. If GemGS is used with GS 2.61, the "Windows" option should be turned OFF. Windows will still be used, but GemGS will not attempt to suppress all text I/O. I hope to update GemGS soon.

Utilities:

vr_t_fix.prg - This auto-folder program fixes a bug in GEM system software which causes the vr_trnfm() routine to fail on large images. This bug can bite if you are viewing images on the screen at > 150 dpi. The characteristic result of this bug is a scrambled but somewhat recognizable image.

Good stuff :-)

If I wanted not to forward at all there would not be any new versions of my software and I would not support it anymore. It it obvious that the opposite is the case.

> prefer to see things fail. I do not believe each and every

I do not prefer thing to fail but prefer to realistically evaluate a project. And a project where the initiators claim not to announce something before it is available looks not realistic at all after they did exactly the opposite, i. e. making announcements that now appear more than absured with the core of their hardware not being produced at least for one year. Please, think about what it really means to announce a machine without its processor being available for at least a year.

> Should a developer look here they will start to think why
> bother... I don't see such discussions helping matters at
> all.

Those who develop for the Atari know very well how to evaluate the market situation. Haven't you noticed that there are hardly any developers in this group at all?

Why should I? It's you who advertized for the Amiga, not me. I'm perfectly happy with my Linux machine. Power without the price is a term that was once true for the Atari. Today the platform that comes closest to it is a Linux box. And if there were improvements of Atari emulations like STonX you could even run Atari software very well and with high speed. Some people prefer waiting for expensive hardware, which will finally not make it to the market, instead of concentrating on improving software projects like STonX.

I dont think you can build a 1gig p3 system for 300$ even if you play with rebates and get alot of the compnant for near free.
Your best bet is with a 700mhz AMD. <300$ will get you the MB (100BT ethernet, 3d audio, 2d/3d 128bit video, usb, etc, etc..) <70$,
700mhz processor <25$, 10gig HD ~70$, 256meg PC133 <25$, case/250W & keyboard/mouse/speakers ~40$, floppy/CD would be
under 50$. So like 280$ in single quantity shopping online.
Contrary to people beleif its not hard for MS or Sony to build 300$ console and actualy make some money on that initiale sale.

I personaly think a 700mhz duron kick any other processor even half its price. How much for a 14mhz 68020ec?
You are probably better off running UAE on this sub 300$ system then on a basic a1200.

The problem is with the apps and general UI system.
Dont know if its still the case, but getting to use an app,
was getting to know the programmer mind under unix for each and every app.
With OSX if you learn how to open a file in one app, great chances more then
that app will use that method.
I overhead people today in a store discovering why they PC with one click cd burning
was not working... they put the original cd in the CDRW and the blank in the DVD player.
Under linux it doesn't take much to have mass user be lost to the point that they need
human assistance. Would you be ready so offer this support to millions ?

Having a user friendly OS is more then having a tweaked kernal on a CD.

Source record: 43651

I'm not reading any of this stupid thread anymore. If you cannot
figure out the difference what is an "example" and what is
said as a comparison. You are an idiot. (uwe) You may be good
coder but you also make a VERY good moron. Be happy in
your doom to all things Atari outlook...

Reply all you like I won't read it, be as negative as you like
I won't see it... I still may post from time to time an announcement
here, but that is all. I discovered this forum is geared more
towards anti-progress and people who wish things to just stand
still or go completely to hell.

If someone needs to contact me for anything see my signature.

I NO LONGER READ THIS NEWSGROUP.

I scan my mail via headers, so anyone who mails me wanting
to complain or such don't bother as I will purge the mail
from my server unread...

I also urge anyone who sees such negative posts, to simply
start ignoring them. If you are a developer DO NOT take
anything you see here serious. The polls speak for themselves
regardless of all the negative stuff said about them.

Later... much later!

Also I think MagiC is CRAP! That is why I don't us it and will
never use it. That was for Dennis. lol

And to Martin, (q-funk) do me a favor and sell the remaining TT
and move on... you'll sleep better at night.

>More and more I get the impression that in this newsgroup liking commercial
>software isn't appreciated...

I don't have anything against commercial software, I have spent
(and still spending) quite some money on commercial app *BUT* I
dislike commercial soft which is still on sale although the
vendor perfectly knows that the developement is stopped. I won't
give one EUROcent on apps like MagiC, Chatter, ASH Emailer etc.
The worst is that they even won't release the sources. People
are begging for the release of Cab but no they just don't give a
damn for their former clients.

>need to be anything flashy, just functional. Some docs in STG or UDO format

This is simply Microsoft inspired FUD from someone who hasn't used a
modern Linux distro. Try SuSE 7.2 or Mandrake 8.0 before spewing more
of this propaganda.

Well i wont agree on this.. Airc runs nicely, its builtin AV things are
very nice, with StringServer even more powerfull. Problem is: Airc by
doubleclicking nick and ftp can call ANY specified FTP application, not
like in Magic case ASH only.. And Aftp is in my eyes best FTP client,
especaly cause its VA and drag n drop abilities, like calling defualt
packer if ZIP is clicked, draging files.. Again, bare in mind, those apps
will run with any client, not only with ones from same company and
comercial. I hope u see my point...

> More and more I get the impression that in this newsgroup liking commercial
> software isn't appreciated...

Well software which act like Microsoft is not indeed.. ASH clients
works only with other ASH clients and they are all commercial... Not to
mention that u must pay if u want to run stik/sting apps, which are most
free.. So u buy OS, apps and if thats not enough, go any pay if u want to
use 3rd party appy.. Worse as M$. U dont need to pay, if u want run FREE
PC program.. MiNTnet for example offers FREE stik/sting and Draconis
translators.. Not to mention that iwe seen with my own eyes, that ASH in
CAB 2.x manuals says that only IConnect offers pppd, that not even MiNTnet
have pppd and that Sting/Mintnet ovls are not free, which is clearly damn
lie.. Yes u re right, i dont like such apps and attitude!

> The concept of IConnect is to offer an easy and reliable dialup connection

> adress the ethernet card and before you know it....

Im not sure, even more, with proper modules is probably easy to
achieve, but without deamons and drivers for NFS, or http/ftp servers etc
aint possible.. And there unix *CRAP* helps a lot. And i just cant stand
that someone say unix is CRAP (well mint fals here) and "why be so stupid

to seetle with 2nd best (to magic)".. Unices can do so much more as
Magic..

> >I sure cant do that.. Why would Unix apps bare in mind specific Atari
> >protocols?
> Because they run on a Atari damn it... it took years before the mainstream
> programmers agreed upon and implemented the above mentioned protocols. These
> ported Unix apps teleport us back to the late eighties, Sorry Janez, but
> I've been spoilt in the mean time...

I like Atari protocols as u do, thats why i love N.AES/Thing combination
a lot. But i will not deny apps which can improve my system (and they run
as addon, u dont need to exit AES) with stuff we can't do, and many of
things i did write were daemons.. with NFS i can drag file from remote TT,
pals Milan (with NFS) located far from me, anywhere i want, so ALL
protocols remains! To clear all, im not defending MiNT as OS here, im
defending unix *CRAP* here, and to show that maybe stuff 2nd to Magic have
their racing horses to show! I wana say that NON Magic system may be VERY
VERY good, if not better.. Sorry, but im willing not to use 2-3 apps (let
say fiffi and chatter) if i may gain things like NFS, and whole word of
Unix possibilites at same time with AES..

> I can switch between TOS, MagiC and MiNT whenever I like. If I need to run
> an application that needs MiNT then I boot up MiNT. I really can't see one
> reason why someone would need to waist his/her precious time porting that
> application so it could be run under MagiC.

Well why change? I bet u would love NFS (i keep to it cause its easy to
explain and offer a lot). U would love it even more, if able to run your
belowed apps (Magic only) as well.. I dont see nothing wrong here.. And
for all those things MiNT net is best TCP/IP stack, its most complete and
apps do NOT require porting! Take MiNT daemon, copy it in proper dir and
enjoy it with Magic.. Why rebooting, have 10 OS-es etc? To balance this,
id love to have "single task mode" in MiNT, and would be glad if easy
solutionm such as MagicNET would exist..

> Every new version of MagiC contained a lot of adaptations to make it more
> compatible with MiNT... if the MiNT developers would have gone through the
> same trouble we might have had at this point in time two more compatible and
> better OS's... the improved MiNT compatibility is at GEMDOS level, so don't
> get your hopes up to high...

Im not, i dont hate Magic or ppl who use it.. Those improvements will
help using MiNTNet handling, and hopfuly UnixFS systems handling, so Magic
users will be able with as little pain possible, to use certain Unix
resources (daemons etc) and expand things.. Why developing own NFS etc,
maybe even making it commercial, if stuff exist, works good?

>
> Let's say I don't wanna start typing and memorising meaningless commands all
> over again, just for the sake of it.

Well i spent 20 mins (with some help) and did chapelie script. By
typing "chapelie" and nothing more, greed connects, dl
"new-this-week.txt" file, then paths are extracted and greed dl all news
from this week.. This is one simple example of CLI power. U type one
command, and u may go back to AES and do whatewer u want, and in few
minutes u have all news from FTP site.

> because nearly everyone here uses it...
> True...one doesn't have to be very smart to type <unzip filename>, but where

> three levels down from that archive? One doesn't need to have a master degree
> but let me assure you that a couple of mouse clicks to achieve the same thing
> is *much easier*.

Yes i agree here. I never claimed cli zip is easier as gui
version. Depacking only, or depacking all files to certain dir is
easy. Depacking certain files to certain paths is lot harder, but u still
can let say depack all in one dir and then copy them..

> Does the word "user friendly" means anything to you? someone new to this
> platform will be able to use the shell within a few minutes... one of the
> reasons the Atari became a huge success was because its user friendly GUI
> and applications, TTP's are the opposite of user friendly...

Yes and no. Im aware what User friendly is, im certain Atari is VERY
user friendly.. Also im aware GUI and all arround it, hoogs CPU. Also CLI
in lotsa cases is user friendly as well (Pine mailer for example).

> Sometimes I wonder if the people that port these programs come from the same
> planet... they obviously must love this platform to go through all that
> trouble, is it really that difficult to add a GEM based shell? it doesn't
> need to be anything flashy, just functional. Some docs in STG or UDO format
> compiled as a HYP file would also be a great help...

It all depends on view.. Personaly i prefer CLI (ttp) in many
cases. Example: "jpegd -N 256 blah.jpg blah.tga" is quickly typed. In some
GUI app that may mean few clicks, menu drags etc.. so not exactly
fast.. On Unix (which u hate and call obsolete) u can pipe data from app
to another.. great and super efficient way, on gui it require starting
more apps, paste/copy betwen etc.. so time consuming.

> Explanation: I have no idea who Frederic Fouche is, he replied to me "we'll
> make sure that the next version can not run on any of those"... so I assume

Yes, still dont sound preety polite, does it?

> And please don't turn this into a OS-War... I didn't mention MiNT in any
> way, neither did I compare MiNT users with idiots. Why are you so sensitive
> about this? can't you accept the simple fact that for someone using his
> computer as a stand-alone unit network capabilities are of no use?

Im not sensitive about that.. Im sensitive (i admit) about politines,
and i happen to use Unix, which u declared crap, 70's monster...

> >Im happy to be "idiot" who waist time on this "gone to the dogs" platform
> I wasn't aware you were a commercial developer, you wouldn't be interested
> I suppose to develop that new browser? :-/

Im not commercial developer, i did few freeware things... Still i like
wasting time and money on this platforn

> >So why are u here then? I dont think this platform needs persons like u
> >giving such commentars...
> Thanks for your opinion... I'm sorry now that I didn't react a couple of

> people here "despise" ASH so much that they even *steal* their software,
> if you honestly feel my comments are out of order fine, I'll just put a
> sock in it and shut up.

Well u trigered it. U praise ASH too much (look comment above). To
backup my view: I was on few Neuss shows, and ASH was there with MAC/PC's
only, running Magic. No ST's at all! Magic's ability to run on lowspec
machines is its biggest advantage if u ask me! Anyoe can run OS on
pentium/PPC! And they also sold MAC games on that show. Combine that with
my previous things, and u will see why im not exatctly ASH fan. U have all
rights to like what u want.. But to call other OS-es/apps crap, ppl " u
and other bunch" and so on makes me piss off. I have own fav apps/OS, i
still dont call other names and im also interested in others..

> software isn't appreciated...

No, thats not true. I bought and still am fair portion of software. I
dont like software which forces me to buy more software.. U misunderstood
my reply.. I have no problem if Magic and its clients are commercial, but
if u have to buy Iconnect/STIK translator, thats nasty. Period.

>Does this person think the hard drive just automatically squirts data into
>the CPU without any instructions from the CPU whatsoever?

The scary part is that this would be trivial to do these days. If the
self-initialization procedure of the Busmaster-DMA IDE controller
simply included a "read one block from the disk into memory location
0" phase, you wouldn't really need any ROM. Just keep the CPU reset
line active until the IDE controller is done. Not that I'd want such a
system --- I don't like the idea of catastrophic hard drive failure in
the first place, but this would give a whole new meaning to the term....

Umm... go to www.pricewatch.com and click on "Processors - PC"

AMD 1Ghz Athlon CPU with 266 FSB are selling for as low as $81.

Complete 1Ghz Athlon SYSTEMs are selling for as low as $350

(Mid Twr, 20HD, 128 Mem, 50XCD, Floppy, Snd, 8MVideo, 56KModem,
2 USB, 120W Spk,KB/MS)

Like he said... it's the times...

Until those newbies start wondering why their programs don't work, and
it turns out to be because they typed the wrong number of spaces, or
confused a tab for some spaces or vice versa.

Python is a rather nice language, but requires a newbie-unfriendly
editor like emacs to keep the programmer sane.

How about Ruby?

Good DVD support? Easy to interface with 1394/DV products? Good set of USB drivers
for scanners/digital imaging? ... Easy to setup internet sharing? SSE/3dnow! Optmized
codecs?
Easy to use 'packet cd' support? How about Video IO, easy to setup & use?

If you tell me this stuff is handled better by the SuSE distribution then Windows XP I will
probably switch my home OS to linux. But other wise I wont take an afternoon to downgrade
my home OS.

If I cant use, or need to download beta driver/recompile the OS, etc... for any of my
peripherial
because the OS dont offer services/drivers I do see a problem using it for a mainstream
home OS.
Do you think linux is not on everyone computer because of marketing only?!?!?

Stephan

It is? Compare and contrast the sales of those silly 'my first
computer' things, PC/Mac-based educational software, and even a
poor-selling console like the Dreamcast.

Hmmm ... I don't think that any of these groups are the right place
for advocating any particular Linux distribution over another. Some
of them are, of course, the right place to maintain that the Amstrad
roXX0rs and anyone who says otherwise is an inferior lifeform :-)

However, I'll come out from under my bridge, take a nibble from your
snack, and say that I don't think SuSE is suitable because of its
woeful package management and questionable security.

The package management is fine for the sort of people using Linux
nowadays, but is inadequate for use in an appliance. In this regard,
I feel Debian comes closest - but is even less appliance-like than
SuSE in many other areas.

[replies to the above three paragraphs will be cheerfully ignored, as
I ain't interested in advocacy]

No distribution (yet) comes close to pleasing me wrt security*. In
this sort of device, the biggest enemy is not an outside hacker
(although they still need to be kept out) but the owner. He must be
prevented from breaking his toy whilst still retaining the ability to
use most of its functionality, including the ability to install
software. The fact that this would break his ability to upgrade the
system isn't that much of a problem. A boot-time option to either
come up normally or to do an upgrade from the net would be sufficient.
I have some fairly detailed ideas for how such a distribution could be
put together, but I doubt most people here are interested in such
arcana :-)

* - not even in terms of securing it as an ordinary Unix workstation,
let alone as an appliance.

Sad but true. One of the great strengths of X is that it does one job
- providing the ability to network graphical applications - and does
it well. Its great weakness is that it does nothing more than that
one job, and hence the proliferation of widget sets, window managers
and desktop environments leading to infinite variety and infinite
confusion.

>With OSX if you learn how to open a file in one app, great chances more then
>that app will use that method.

Pity that OS X is such utter pants in all sorts of other ways :-)

>I overhead people today in a store discovering why they PC with one click cd burning
>was not working... they put the original cd in the CDRW and the blank in the DVD player.

<sigh> it just ain't possible to design human stupidity out of the
system.

>Under linux it doesn't take much to have mass user be lost to the point that they need
>human assistance. Would you be ready so offer this support to millions ?

Me personally? No. I am insufficiently tolerant of idiots to do
luser-support, and there is nothing to motivate me to create such a
distribution right now. But if someone wanted to make a go at it, I
could be persuaded to work on creating and maintaining the product.
Provided he had a good business plan which would keep me in
pay-cheques for a few years.

>Having a user friendly OS is more then having a tweaked kernal on a CD.

Which is why I talked about an entire distribution, not just a kernel.
An appliance distribution is not going to look anything like a
traditional Linux distro. Sure, the end result may be a nice Gnome
desktop just like you can have with other distros, but the underlying
system will be very different.

I don't know why people insist on calling languages like python and
perl 'script' languages. Just because some people use them as that
does not mean that that is all they can do. I have written some
rather large applications in perl, and colleagues have done the same
in python. They are fully-fledged programming languages.

In message <9ipvssbjm1@plutonium.compulink.co.uk>, sidcelery@cix.co.uk said:

>That may not be irrelevant.

Harry, please re-read what I said. CAB wouldn't initialise except in high rez but locked up with the first(?) 'Loading xxx' module dialog. I don't think GDOS has been called yet at that time.

>I won't comment on the TOS issue because I don't know, but are you
>really sure that GDOS is set up properly? CAB uses the fonts it is
>pointed to in the OPTIONS\FONTS menu. The fonts used in GDOS are
>different for medium and high res (a different width to height ratio).

I am not sure as I no longer have the disk. But again, surely if the fonts weren't there for a given resolution then CAB would use the system fonts.

>Note also, you won't necessarily have the same font sizes in Medium
>res as you do in High res. This may be the reason for differing
>appearances when displayed in CAB.

I realise that, thanks. As I said - you couldn't run his CAB setup in medium or low rez at all. His GDOS and fonts came from an ST Club disk with STDCAT on. The 'differing appearance' I mentioned affected just the first para after the header in high rez, though it had the same font size tags as all other paras, which were OK.

Regards, /Peter/

1790. Vortex Hard drives....

Hi,
is anyone familiar with the old Vortex external hard drives. I have a
40MB version which has packed up.Can a standard SCSI mechanism replace it?

Chris Thorley.

OK, Pentium III 1Ghz is $172.

A complete 1Ghz Pentium III SYSTEM is $418, same specs as above.

A far cry from $600, or "over $1000".

Again, it's the times.

No platform is dead as long as 1 person is using the computer in question. We Atarians owe much thanks to people like Lonny, Uwe and Odd. But even it they all called it quits, I would still use my machine. The day I change platforms is the day my Atari computers go dead and I have not place to send it to to get fixed.

> truth are facts like non-existing processors.

Yes but there are different ways to interpret what that may result in.
I don't say you necessarily are wrong when saying this and that will
fail,
what beats me is **why** you spend all this time trying to convince
people not to believe in those projects. You are entitled to do that of
course. Just like I am entitled to say that I am completely fed up with
your negativeness.

Go on bashing, I won't disturb you anymore.

1800. CT2 and MajiC 6

Newsgroup: comp.sys.atari.st
Date: 2001-07-16 01:04:25 UTC
From: bjr@localink4.com
Message-ID: <78d87076.0107151704.763e323a@posting.google.com>
Source record: 43669

An amuseing little problem has developed.
I recently found myself needing to revert to my old SM124
monochrome monitor with my CT2 Falcon. Also, I'm without
fast RAM at the moment in my CT2 so only the TOS 4 turbo
mode is operative. Everything I have works quite well in
this mode so far *a good 20% to 50% work time increase on
most tasks*, except...Majic 6. Yes I know! I need to get
Fast RAM...it's on the way ;) So is an FPU...meanwhile...

Well, MajiC 6 seems to be working in this mode also! The problem is,
somewhere in the booting process MajiC pulls the screen to black and
then boots. It never finds my screen again, thoe it's sending output
to some screen driver somwhere...I can tell this because if I swap the
turbo mode switch off, I see the majic desk top just as it should be.
Of course, it's frozen from the hard switch...point is...it WAS there
and running...just on some screen device the CT2 isn't seeing? I also
had MajiC's desktop auto start a Wave Player and sure enough as the
screen sat black, MajiC started the music and the app played the wave
happily through my external speakers (and the SM124 speaker).

So here's what I've got:
CT2, No Fast RAM, No FPU, Flash ROM 1.37
Conner 80meg IDE
Seagate ST11200N Hawk 1 SCSI
Seagate ST32550N Barracuda 2LP SCSI

Cecile 2.15

HD Driver 7 (Cecile never has worked well for me) mounted to IDE
but I've set the ST11200N Hawk as Partition C to boot from this
drive. Nothing is on the Conner but the HDDRIVER.SYS booter.
Yes, I've also tried various combinations of Hard Drive boots...
even removeing the IDE drive all together. It's also worth
noting that I have and CAN boot from the IDE drive in Turbo 4
mode and still everything works BUT MajiC.

HD Driver works with everything BUT MajiC, seemingly error free...even
thrashing the SCSI Array with CueBase Audio!

Cecile 2.15 also works with all but MajiC but
is much less flexable with partition orders and the like so I
really prefer HD Driver if it's possible to stay with it. Also,
Cecile will not boot MajiC at ALL unless I have a copy of it on
a floppy in Drive A. Trying to boot MajiC with Cecile, I get a
system freeze after MAGICBOOT runs...all the softrests I can punch
in do NOTHING other than occasional bombs and sometimes an error

message like weird getstarted or fatal gemdos error.

I've read and tried everything in the CT2 documents at least 3 times.

Auto Foler:
MAGICBOOT.PRG
NVDI.PRG (Version 5)

ACC:
COPS
CPX:
MAGICCNF
FGENERAL
TIMESLICE

All Magic START apps are disabled and or hidden

In theory this should be a very clean boot.
No Floppy is in Drive A so a hidden boot sector shouldn't be a
culprit.
Also get the same results when booting without NVDI 5...black screen.

Note: I also have this same problem if I go back to to earlier Flash
ROMS
and Cecile 2.12.

Things I've tried so far:
Yes, I ran the MajiC Patch!
I booted in normal non turbo tos, where MajiC works fine, ran the
config
application and tried a resolution of ST Hi (the only one offered).
That apparently sets in MAGIX.INF
_DEV 5 136

I also tried clicking the option NO RESOLUTION CHNAGE
Wich apparently sets in MAGIX.INF
_DEV 1

In both cases, the screen goes black in Turbo 4 mode.

I've tried tweaking with the video modes of the CT2 bios screen,
also with the bootc NVRAM application. I've intalized it and started
from scratch more than once just to be sure (as the docs say to do).

Any ideas how I can force MajiC to call my screen back up?

Thanks,
Brian

Okay, this is where I show how little I know about upgrading the basic ST setup (lol!)

I have a Mega ST4 with TOS v1.02 (very buggy OS !) with a MegaFile 30.
It's been over a year since I recently installed all the my software on it, the ST had remained unused for about a year, so I've just dug it out of the grave again :)
The software on it consists of; GDOS, PowerDOS, Universal Item Selector III and fldr200.prg (am i right thinking its a software bug fix for TOS 1.02?).
Thats about it. I have obtained a floppy in which i can boot into MultiTOS, but am not quite sure what to do with it !! Is there not a simple way to connect to the internet using one program ?

JonG

Also , while im here.. is there any program i can use to transfer files from the PC straight to the ST thru a parallel / serial link ? It's a pain having to use floppies ....

I tried it earlier on today .. the drive would (just about !) fit, but the
extra mainboard and power supply were
too big to fit in :(Also I dont think there would be a way to screw down
the extra board + power supply.
However it looks as if the positions for screws for the drive are already
there in the ST case ....

Well, since PC Word definitely has more features that Papyrus supports,
why not make a list of the features Papyrus will support for you, and
forward it to them telling them to stick to those features?

> I use Papyrus8, which usually has no difficulty with PC Word docs. Tonight

You need to find someone who can print it for you so you know what the
Word doc looks like.

I wouldn't mind that kind of graphics, and that kind of text mode,
so long as the character sets are redefinable, and one of which
implements a conventional Commodore graphics character set (which
so many people seem to have memorized).

Hardware:
- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution,
high contrast, black and white is fine
- semi-portable design (something which can
be moved while I'm working, but not something
which I work on while moving)
- 64MB to 256MB RAM with battery backup, for
storing documents. Or use flash memory if
it is cheap enough.
- HD 3.5" floppy, for communicating with my
other machines

Software:
- task switching. need not support running
background processes, but I should be able to
access other software while working
- mostly command driven, put pointer is also
available (I'm viewing this from a programming
standpoint. I don't want to waste time
learning an event driven interface, along the
lines of MacOS or Windows, for a "hobby
machine")
- a default command set which resembles the
more common unix utilities
- programming language must support graphical
output, using an easy to learn model (as most
versions of BASIC had, or PostScript)
- a machine language monitor, and an assembler
should be provided by default.

These specifications are purely from the hobbies perspective.
I believe that this is something which I could put to productive
use, yet still learn the workings of (and program) with a decent
level of competence. It should also be easier to document than
the modern batch of PCs and Macs, which everybody appears to be
drooling over.

Who cares about getting with the times. I can't figure out what
to do with a 50MHz box, let alone a 1GHz one (let alone the 350MHz
one I'm on right now).

I would expect something like this to cost between $100 and $200.

Byron.

Why should I spend less time on this than others spend on trying to
convince me that those projects will be a success?
I suggest that you participate with the irc chat Wednesday evening on
#atari.de (English spoken if required.) You can talk with a few other
developers there. But be prepared to hear the same arguments that were
rejected in this group.

Just for the record: More than two years ago some developers including
were asked whether they would support the Milan II, I was quite sure
that the project would fail, in particular because they believed in
selling 100.000 machines in a few months in Germany alone, but
nevertheless I made sure that my software was compatible with this
machine. The Milan II project failed.
Also about two years ago Rodolphe Czuba asked me whether I would add
support to HDDRIVER for the secondary IDE port of his CT060. I said that
chances were good I would do so, provided the CT060 would actually be
finished. I did not expect this to become reality and I was right again.
This year we have had announcments of a new clone for quite some time.
The only difference this time: Even more promises and the project is
even more complicated than the others. Based on my previous experiences
I did not expect any result from this project. It was said that nobody
would jump to conclusions before something was definitely available. But
the opposite happened: Announcements were made and the initiators were
so blind that they wanted to use a processor (even though the 4e was
never planned to be a full-fledged processor, if I understood this
correctly) that is neither as compatible the the M68K series as they
claimed nor will it be available any time soon.
So has any of these projects helped the Atari market? No, on the
contrary. As soon as the Milan II was announced, people stopped buying
the Milan I but waited for the Milan II instead. German dealers were
really shocked by this. They could have sold more Milan I but after the
announcement they couldn't. When the Milan II failed some dealers had to
close down, some had even debts because the announcement prevented them
from earning money with the Milan I.
So the way the Milan II project was handled eventually was harmful to
the Atari market. The CT060 failing had not such an impact because only
a few (Falcon only) users were interested in it anyway. And now we have
a project where the initiators were so negligent that they did not even
bother to carefully check the availability and fitness for purpose of
the CPU.

Is this the right way to go?

Hi

For sale, an Atari STE with 4M (4 X 1 SIMMS) a,d mouse in VERY VERY
good condition, not yellowed as ALL.

ï¿½25.00 + P&P in the UK only.

I also have a STFM in very poor condition but works no problem. Its
yellowed and has two key caps missing with the shaft broken too. Its
usfull for 'sacrificial' system of parts. As i said, it works perfect.
It has a double sided drive.

ï¿½5.00 + P&P (Which will be more than the computer!!)

UK ONLY

Brian

You couldn't get that much ram on a 68000 because it only
has a 24 bit memory bus. You would have to go to a 68030
or so to get the wider data path.

Worth upgrading that OS, it's known to be buggy when used with a hard drive.

>The software on it consists of; GDOS, PowerDOS, Universal Item Selector III
>and fldr200.prg (am i right thinking its a software bug fix for TOS 1.02?).
It fixes the bug which bites if a certain number of folders (40 IIRC) are
opened during a session. Your foldr100.prg has been renamed to foldr200.prg
to allow that many folders to be opened.

>but am not quite sure what to do with it !! Is there not a simple way to
>connect to the internet using one program ?
STinG or STiK are used to connect to the Internet, then you use a client
program to do the actual information exchange. NEWSie will do news, email
and ftp (and a very basic browser), CAB will sort you out with web access
(and you can configure it to call the ftp client, in this case NEWSie) if
you happen to click on an ftp:// hyperlink.

>Also , while im here.. is there any program i can use to transfer files
>from the PC straight to the ST thru a parallel / serial link ? It's a pain
>having to use floppies ....
I've mentiond PARCP in here in the last week.

I have to agree.

Let's just limit it to installation. I've installed many versions of Linux over the years. Each one something of a challenge that would floor the average computer user.

OK, I admit that when I installed Mandrake 8.0 on a loaded Pentium III 800 it was a snap. It even recognized my Sound Blaster Live! and a Linksys NIC (Tulip) without any help on my part! But when I tried to install the same distro on a Pentium 100 -- same NIC and a Sound Blaster AWE32, it bombed miserably. I do have Red Hat 7.2 running on that machine, but it was hand-configuring all the way. It would be torture for anyone who was brought up on Windows.

Still, I wouldn't be discouraged about putting it into a $300 computer. Lets assume a high degree of uniformity in the hardware of such beasties. A distro of Linux, or any other OS could be designed to install easily in such a limited hardware environment and probably could be run and maintained just as easily.

I'd also have to say that users of such machines as Atari 8-bits would have the mindset to deal with any problems that came up.

Take care.

Alan

Nice try. You seem to be among the first to get involved in these threads and will at an early point make rude statements about how silly or ridicilous these plans are.

Noone is trying to convince you these projects will necessarily be a hit. Merely suggesting you made your point of view clear regarding clones and some other projects long time ago. But being so negative in general (about both possible new hardware and browsers and stuff like) might IMO be putting people interested to participate down. I have no illusion there will be a CAB-killer available next week, but I have great respect for the efforts put into eg. the Highwire project (which btw seems active again) and hope it will turn into a useable program some time.

If the pledge system could boost the Highwire works I would definitely take part of that one, since it seems like the best candidate. Either that or if Wensuite sources are released (or if authors keep on working on it). A commercial browser is not going to happen from what I can tell. That is WHY I feel it is better to encourage them instead of insisting it can't be done.

One thing, I am *not* saying that the arguments should be rejected and I clearly understand why it might be bad hyping projects. I just happen to believe the opposite is not that good either, and I have heard them arguments enough times by now so I will take a pass on the IRC invitation.

Nope, you (actually) have a point in what you are saying. Some are way too enthusiastic towards new projects, assuming they will be successful even if they are just in planning phase. I believe in such a project when I start hearing about working clones being tested, until then I won't judge them either way.

Why where my statements rude?

> great respect for the efforts put into eg. the Highwire project (which

I can't comment on this. Never heard of Highwire before.

Anyway, I think this thread has come to an end now. The future will tell
what really happens with all these projects.

I felt as though I needed to throw in a bit on this subject.

You wouldn't have much choice on the CPU because the older the chip, the harder it is to get. Designing with the latest allows you to get production quantities with manageable lead times so inventory can be kept to a minimum. The older the chip, the more you have to buy at one time to assure you have it when it is in short supply or no longer available.
Also, you have to use larger memory blocks/chips for much the same reason as above. If you can design and build with the most demanded memory, it is cheaper to get but takes longer because of demand. Compare the cost of 256 meg of: PC2400 DDR to PC133 EDO and you'll see what I mean.

Much has been said in this thread about why some one would design or buy such a computer rather than buy an intel type pc(PIII). IMHO, it is more a question of following the group and being a MS slave or trying something new and different. Perhaps even doing so while not filling bill gates pockets with even more money. I'd mention apple but MS has got its fingers in that pie too.

My old Atari (400 w/flat keyboard through an ST) were reasonably stable, fun to use, great learning tool (both for hardware hacking and software) and were ahead of their time(well not the ST<GRIN>)..

I'd gladly trade my Athlon based PC for a good, fast, up to date Atari type computer. But unless it had software that is "compatible" and up to date, it really is a "pipe dream".

I'll step off my soap box. That's for the chance to express my opinion(s)

1816. STFM Question...

Newsgroup: comp.sys.atari.st
Date: 2001-07-16 13:13:55 UTC
From: Michael Robbins <michael@mrobbins.freeserve.co.uk>
Message-ID: <9iupag$t2p$1@newsg3.svr.pol.co.uk>
Source record: 43686

Hi all,

I recently acquired a 520STFM that was advertised as having a broken floppy drive. I had owned one of these machines some years ago, and still had an Epson SMD-380 drive that I knew was working, so I had planned to replace the broken drive in the STFM with this drive.

However, the machine I received through the post looked a bit different to the STFM that I had owned before - it contained a floppy disk drive that has a slot that is shaped like an off-centre parallelogram, with a very large eject button along the bottom side of this parallelogram. When removed from the machine, I could also see that the drive was much bulkier than the SMD-380 that I had in my last STFM... I assume this is an old single-sided drive??? I've never seen one before anyway...

Anyway, to the change of drives. The old drive had different connections on the back of it to what I was expecting - there is a 14 pin single edge connector and a similar four pin connector. Theses were connected to a board under a shielded unit next to the drive - this board is marked "C100977 REV" and I assume it to be some sort of floppy controller, as it is connected to the motherboard by what appears to be the standard floppy drive ribbon and power cable - I removed these connectors from the board and plugged them into the sockets on the back of the Epson.

I've not tested the machine yet, as there was no power cable included and I'm reluctant to power up a set-up that is based entirely on guess-work.

Questions then:

1) What is the C100977 REV board used for? Am I alright to disconnect it from the motherboard?

2) Am I correct to plug the (what appears to be) floppy drive cable and power cables from the C100977 REV into the Epson SMD-380?

3) If yes to the above two questions, is there any easy way to secure the drive to the bottom half of the case? The old drive was MUCH larger and the holes on the Epson do not match up correctly - it therefore seems inpossible to keep the smaller drive secured within the larger space that it occupies.

4) Does anyone have an ST cover that will accommodate an SMD-380 drive that they would be willing to part with? The type that has a small parallelogram-shaped hole to accommodate the eject button. I'm reluctant to cut the case to allow the eject button to fit....

Any help would be greatly appreciated.

Many thanks.
Michael Robbins

Then throw in some sort of decoder for the 64-256MB chunk. Since it is not the main memory (that would be the 4MB chunk), it should not make much of a difference. Indeed, it need not make any difference to the average programmer, since it would (presumably) be access through a set of file system calls.

Besides, isn't the 6502 limited to 64kB chunks. Apple simply implemented some sort of paging mechanism to access the 128kB found in later models (IIe/IIc). Likewise for the 192kB card which I have lying around here, somewhere. (Though my understanding is the 1MB card for the 8-bit machines used some sort of window into memory.)

Byron.

Memory Management Unit which really extends the addressing
the processor has. To the programmer, it is as if you had 32 bit
addressing. You set the MMU chip to "bank" of RAM you
want and pass the rest of the address to memory bus. However,
you would then need to develop a MMU and the added cost
of R&D would increase your cost to build. It would be safer
to just move to a 68020 or 68030 processor and bypass the
smaller bus. I would think the chips are not much different
in cost these days as they have been around a long time.

I seem to recall that the Mandrake 8 graphical installer needs something
like 64Mb of RAM and having less is pretty much the only thing that I've
ever seen cause it to bomb out.

And Red Hat sucks big time. Even the latest version.

You've a point there, but for the moment there is little that I can do
about it.
>
>BTW is there an index? I wasn't sure where to find that either! D'OH! :)

There is an index. Look for index_all.txt (or index_all.txt.tgz).
Unfortunately it's slightly outdated. For the moment I can't make a new
index as I lost my SSH connection with the server. I hope this will be
restored (with some other problems) very soon.

>
>Thanks mate, I'll grab it now! (I've a PDF file I want to read!) :)

Ghostscript is a great app. It works slowly but good. You'll find that
sometimes a pdf only list a few pages. If this occurs just convert the
pdf into a ps file with the included pdf2ps.ttp.

Everyone who has bought the N_AES CD is a registrated user of the N_AES
version of Thing. This version can only be used with N_AES.

AFAIK, the author of Thing hasn't a website.

1826. Color VT102/ansi Over telnet/ssh

Newsgroup: comp.sys.atari.st
Date: 2001-07-16 16:44:25 UTC
From: bjr@localink4.com
Message-ID: <78d87076.0107160844.262a68b7@posting.google.com>
Source record: 43597

It's been a while since I've been online with my Falcon...
What is the latest in terminal emulation via TCP/IP
for Falcon now?

As I say, it's been a while since I've been online with an Atari...
Last I tried was something called Teli for MajiC...and it was in very
early versions with really slow and dodgy emulation...it also required
PPPConnect
who's CAB ovls and other clients were not as up to stuff as the STinG
ones, nor were any of them free, as good, and as well supported as the
the STinG ones...heard about ifusion, but no clue where to find it.
And still...Teli only worked with MajiC...The other option was to
install an entire mintnet system just to run TosWin...no
thanks...that's a bit much just for a decent telenet emulation.

The wish list is something that runs under TOS/GEM via STing in a
window, is FULLY vt102 compatable, supports color, and ssh would be a
really nice bonus for those of us who'd like to get on accounts with
sensitive passwords and personal data.

If no such term exists, does anyone know of a good dial in based term
with open code to start with, and add in the new support?

I.E. Connect, or STalker, or Flash would be a perfect place to start
thoe I don't know if source code is avilable...just add in support
to pipe into the tcp/ip stack. It already has excellent emulation and
compatablility that works on all TOS machines! Then as a bonus, one
could eventually add ssh encryption...possibly even port forwarding
features of some type for secure proxy like channeling.

Also Telstar was a great start! It just needed to be finished
emulation wise and have the ansi and color support added.

Telnet for Sting had good solid VT102 emulation, but still no color
and it
really made a mess of the screen with the funny way it wrote in its
window.

Any advances lately?
A really solid feature packed terminal makes any computer very
valuable...
It's one thing long neglected on the Atari platform.

Sad when it's a major headache to log into a unix account and have to
pull out hairs just to get VI and a few other basic standards
displaying for you...
and having go in and disable about half of the display features that

make them
nice utilities to use.

Enough ranting and wishing...
It's good to be back online with my Falcon...
Getting ready to get out my wallet and make alot of software updates,
as
I'm learning a good bit of progress HAS been made on alot of things
Atari.
Hopefully a good terminal is one of them ;)

Brian

> 'script' languages. [...]

The way that I differentiate between 'script' and 'compiled' languages is,
roughly, this...

If the compilation (and linking) step is commonly separate (C, C++, Pascal,
Ada...), it's a compiled language.

If the compilation step is integrated into the runtime environment (Perl,
Python (I think)), it's a scripted language.

If the compilation step is omitted altogether (BBC BASIC and purely 8-bit
BASICs), it's an interpreted language.

Hiya

It depends what you mean by CD's for the ST.. I think I have around 40,
but there are lots I don't have.

This is what I have to date, some are also in transit:)

NCDS CD-ROM series disks 1 - 11
Crawley Collection Vol:1 & 2
Suzy B's Atari Software Treasure 1 & 2
Atari Mega Archive Vol: 1 & 2
Classic Klassiker als Emulatoren
Electronic Spinister PD clipart collection
Al things Falcon (includes software that will run on ST as well)
Bird of Prey (as above)
Atari Gold
Moving Pixels Collection
Skyline CD & Skyline Deluxe
Whiteline Gamma, alpha & Transmission cd's
Atari Computing Millennium Time.capsule
Atari ST computer (maxon and sono press) cd one of the first, if THE
first, atari cd-rom>
The Atari Compendium
The Atari Coverdisk Collection (v1)
Portfolio Club Deutschland

If you have anything not in this list, then I will be interested. I do
have THREE cd in the above list for sale or swap etc: electronic
spinster clip art, the atari cd (maxon) one, and possibly the
transmission one.

Not forgetting the Atari coverdisk collection: which includes the entire
cover disks for -

Atari World
ST - Amiga format (before they split)
ST Format including subscriber disks
ST Review
ST User

It was not a company that stopped selling the Milan I but after the
Milan II was announced there were no customers interested in the Milan I
anymore. The dealers wanted to sell but the customers did not want to
buy the old machine (Milan I) anymore.

Hiya

Yep you got an old stfm with a single sided drive, althoug a few were
released with the same type of eject button with a double sided drive.

In article <9iupag$t2p$1@newsg3.svr.pol.co.uk>, Michael Robbins
<michael@mrobbins.freeserve.co.uk> writes
>1) What is the C100977 REV board used for? Am I alright to disconnect it
>from the motherboard?

This sometimes is connceted to the drive itself or screwed onto the top
of the motherboard shield next to the psu.

Just remove this, it's an adaptor so the drive can be connected to the
interface:)

>
>2) Am I correct to plug the (what appears to be) floppy drive cable and
>power cables from the C100977 REV into the Epson SMD-380?

You can plug the 34-pin connector into the disk drive (schugart
interface). Some ST's have the locator lug the wrong way around. If you
plug it in upside down and power up, the drive motor will run ALL the
time. Just cut the lug off and try it the other way:)

No damage SHOULD be done as all odd lines are earth/ground.

>
>3) If yes to the above two questions, is there any easy way to secure the
>drive to the bottom half of the case? The old drive was MUCH larger and the
>holes on the Epson do not match up correctly - it therefore seems inpossible
>to keep the smaller drive secured within the larger space that it occupies.

The old drive will have been deeper that;s about all, so you will need
to lengthen the supports a little to line up with the drive hole. The
brass locator support will also be small.

I've used rawplugs in the past for giving my that little extra. If you
can get the ones that you cut down to size your self, they are brilliant
replacement support posts AND quieten the drive down as well.

>
>4) Does anyone have an ST cover that will accommodate an SMD-380 drive that
>they would be willing to part with? The type that has a small
>parallelogram-shaped hole to accommodate the eject button. I'm reluctant to
>cut the case to allow the eject button to fit....

I do have some STFM double sided cases for sale, along with the other support bits etc. Drop me a line.

IIRC, as i have one downstairs, they use their OWN software to access
the drive. Normal software drivers like HD driver and adhi don't work
with them, and I also think they are an MFM or RLL drive mechinism.

I have tried replacing the drive myself with no luck. The model I have
has room in the case for 2 drives, with only one being fitted.

Same here, they may not wish to give refunds but I think they may be bound
by law to do so if there are complaints about the rip-off.

>changed mono/colour?.

AFAIK there are *no* separate RSC files for mono and colour - in
any case my 2.7 runs in both. And the manual says 'CAB is
resolution independent but at ST-low (320x200) not all of the
dialogs fit entirely on the screen.'
On taking a closer look at the manual I see 'CAB runs on any
computer using the Atari (TOS) operating system with 2 Mb or more
memory.' His STFM1040 only has 1MB, so could that be the problem?
The manual goes on: 'Memory requirements for images depends on the
number of colours used. The greater the colour depth the more
memory is required.'

But this says 'for images' and CAB didn't get as far as loading!
So I am still a bit stumped.

Regards, /Peter/

Again, we DO not have a project, we had a poll.. If i ask ppl whats
their fauvorite food, that dont mean ill start cooking it.. We just had a
poll about browser and if ppl would be wiling to pay for it thats
all. AFTER poll, there someone could start thinking about it.. But since u
are mister know all, and u say no use of doing anything really, i wonder
what will happen anyway.. But in any case, there were NO project!

> Is this the right way to go?

Is your bashing right way? Personaly i doubt browser can be done in
decent time, even more, after that time html/Stuff will improve a lot so
project will again be behind the rest of the world. BUT i wont stop anyone
talking about, making poll's. I will offer help if im able to and someone
wil have the guts to get it going, even if not finish!

Janez

P.S. If company is so stupid, that stops all selling (milan 1) only
because announcements, and verbal promises, they deserve to
bancrupt. Store business cant live out of promises. Noone stoped selling
win95 when 2k were announced!

: or 68030 processor and bypass the smaller bus.

Perhaps I'm oversimplifying things here but, assuming 1MB pages into this secondary memory, wouldn't an 8 bit register attached to a decoder suffice?

As per the 68020 and 68030: it sounds great wrt speed and functionality, but what would be the cost in complexity (for the end user, of course)?

This is, in essence, a machine which I would want the user to be able to pull apart and modify, if they so desire, without a degree in electrical engineering. I have seen people modify the old 8-bitters, and there are people who will modify (for example) the TI-89/92 calculators (which are based on the 68000). I have not encountered people who go to such trouble for i386 or later, or the PowerPC. Just peeking into the processor manuals for those beasts is very intimidating. I can hardly imagine what a complete set of documentation for a modern PC would look like, if such a thing existed.

Byron.

I think the BBC when released was very good, especially the graphics
department. Also I think it may have been expensive too, for some reason
I still see ppl trying to seel them in local papers at around ?100 with
dot matrix printer and floppy drive. Crazy?

Has this problem started since you put the SM124 on the Falcon? If it has it certainly sounds like sync rate problems. Erm, I'm no CT2 expert (never seen one!) but I think the Videl is boosted to 50Mhz and also you can have another pixel clock at 32 or 36Mhz. I'm also not sure which pixel clock (3 in total on the Falcon) are used but if it's one of those then you may get problems as the SM124 is fixed freqeuncy. However if it only happens with MAgic them I'm not really sure.

I would go into Magic normally and change the resolution to ST hi rez by going "change resolution" then "save". Hope this helps, I don't think many users are using the old SM124 on a CT2 Falcon!

>connect to the internet using one program ?

Well, folder200 is a fix, keep it. PowerDOS, don't know, not really
needed for internet access! NVDI is better than GDOS, faster screen
updates. You should pick up Stik2 and get that running as an acc and make
sure it conects OK to your ISP. Once thats done then get whatever client
you need. Try Newsie for news and mail. HSModem is yet another patch for
TOS thats needed for good serial port transfers. ST is limited to 19200
connection speed unless modified.

>Also , while im here.. is there any program i can use to transfer files

HDDRIVER works with them. At least it did the last time I had access to
Vortex drives. These drives are compatible with other drives as far as
reading and writing of data is concerned. There are differences to other
drives but these should not affect most hard disk drivers.

It's up to YOU what you do with YOUR projects. I was referring to a few
projects in particular. I am also proceeding with HDDRIVER. So what?

> I see. I agree with that. Still company dependant only on one machine
> aint to smart thing to do...

I think you misunderstood me: This machine was the last resort for some
companies. The project failed and the companies were bancrupt.
In case you mean that should have relied on another platform (e. g. Mac
or PC) I agree. Some companies did so (e. g. ASH) and those companies
are still alive today. And still sell software for the Atari.

> <snip>

WRONG WRONG WRONG!!!!

Go check the 68000 Data book. For that matter take a course in basic digital electronics. A 24 bit address bus will support up to 16megabytes total with no extra tricky hardware requireed. Btw, the data path is irrelevant to amount of ram a cpu can address, data bus is strictly for moving DATA, wider will give shorter read times for large values. the Address bus determines how much memory is available without resorting to such things as bank switching & so on. Btw, the 64 to 256 megs of flash mentioned could be addressed with some additional hardware. This is not "pie in the sky fantasy", but the common techniques used on apple II, commodore & atari 8bits that supported more than 64k of ram + roms.

Hi Nigel,

I remember hearing stories of a crawly crypt volume 3 being worked on but haven't ever seen it, even on the crawly crypt website. Another one that will be out in september is one I'm helping assemble of the shareware / pd library of the user group I'm in, TAF. I'm pretty much doing this on my own as the clubs for all intents and purposes is otherwise dead. It should be a full cd-rom since the club has over 600 ST disks and a couple hundred 8bit disks. I'll post a message in this newsgroup when its ready for sale. as I said it'll likely be in september that it becomes available.

An unfortunate design defect of the 80386 is that it can't
execute 6502 code. Maybe if Intel could get its sh* together,
it would design a chip that we here at comp.sys.cbm might
actually be willing to try out.

Python can be either, just like emacs Lisp. Of course, it 'compiles'
to a byte-code which it then intreprets, it's not *real* compilation.

Perl also has seperate compile and execute phases, although at present
you have to do truly evil things to presuade it to spit out the
byte-code.

However, I think that that differentiation is bogus. It means that
most implementations of Lisp are not programming languages. It means
that if (god forbid!) you were to run C in an interpreter, it would
not be a programming language.

Dude. He said he wanted 64 meg to 256 meg of RAM. A
68000 with only a 24 bit address can't address larger
memory schemes. 16 meg would be the limit of a 68000.

The CT60 project has stopped? That's new. When did this happen? Last I heard Rudolphe was still working on the thing, although it was going to take a while.

> Is this the right way to go?

Here's how I feel about this whole mess... I personally hate extremes. I do get excited when I hear of some announcement of a project, or a poll to see what kind of support is out there (like what started this). But I don't say, "this is definitely going to happen," and would never give money to something until there is proof of its existence, and I was able to get one now. On the other hand, I won't go around saying, "this project has no chance," and booing any attempts to do such a thing.

Yeah, there are other projects that might be more possible that would benefit the community, but if that's not where a programmer's interest lies, it's not going to happen anyway, so why not let them shoot for the impossible and at least have a small chance of getting something useful out of it? If nothing else, it might give the programmer more experience with larger projects, and give them the abilities needed to do other projects that we would benefit from that they might not have been able to do or have thought of doing.

Basically, I don't like seeing anyone so gullible that they'll fall for anything and get gung ho about it, and I also don't like seeing anyone so pessimistic (or "realistic" as you call it... it's still got the same effect) that they'll bash any attempts at a project, and anyone who supports the attempt. I've seen enough things happen on this platform to know that when someone says, "that's impossible" they are generally proven wrong at some point. I've also seen enough to know that when someone say's "that's definitely going to happen on x date by x company or person" that it in all likelyness won't. So let's just wait this out and see what happens instead of getting pissy at each other and having important people abandon this group (like Lonny just did). It's not worth it. It's better to support vain efforts than to ridicule the platform and this forum out of existence.

> in 1986!

Apple crippled the memory on the early machines. The later
LC had 10 meg of RAM available although 6 meg was set
aside for ROM. The Mac Plus was even worse. It was limited
to 4 meg because Apple didn't let the Mac support larger than
1 meg simms. It only had 4 simm slots. To go larger it had to
support larger simms like a 4 meg simm. However, on the Mac
Plus/SE, Apple set aside 8 meg of address space for ROM. This
limit was not broached until Apple decided to make 68020 based
machines with larger address space. He is wanting 64 to 256 meg
of static RAM.

I agree. Think about how useful it would be if a computer had 8 or 16 I/O on the board which is left unsused for hardware guys. Switching on accelerators etc. Look at how much use the RTS of the 6850s got on the Atari. It would take seconds to implement in the glue.

Too true. The gap between home hardware/software developer and big businesses has grown huge. Back in the 80s you could whip up a game in a couple of months and sell it and often beet the big guys! Remeber Manic Miner?
However I hack 386 and 486 machines as they're excellent for learning on. You overclock it too far? Get another off the scrap heap! Useful parts in them, Flash ROMs, Cache, SRAM. I crave for new learning experiences. I've got quite used to ISA and the way these thigns work. My 486 runs very fast, just a bit slower than a 486 DEC server! It has 50Mhz bus with no WS to VL bus.

You could say the same thing about e.g. Javascript too: it has a full
set of bit-fiddling operations, numeric operations, string operations,
and it's even object oriented. But it's still considered a 'script'
language....

The reason these languages are called 'script' languages is probably
because programs in these languages usually are interpreted rather
than compiled.

"But Basic is interpreted too!!!" I hear you cry. Yes, it used to
be, but that was a long time ago - today it's usually compiled.
However, it is still sometimes interpreted - one such example is
VB-script.

A vendor, however, will be paying for OEM Windows, not retail. The OEM version is usually much cheaper, but with stricter licensing (i.e. must be sold with a computer, can't be installed on another PC, etc.). So, figure US$50-$75 for Windows, maybe even less.

Hi again,

Many thanks for the replies.

I have installed the Epson Double Sided drive into the case alright, it does just about bolt onto the bottom half of the case, but does sit too low. I'll try Steve's idea for raising it once I get the correct top to accommodate the new drive...

The drive seems to spin up OK and makes what I remember as being all the right noises (it's been a long time since I last owned an ST!) it makes short "clicks" when trying to boot off the ROM (no disk in drive), a short seeking hum when booting off a normal disk, and a lot of those distinctive seeking and "grinding" sounds when booting a game (using Auto). I can't be absolutely sure that it works yet because I don't have an RF cable to test it with, but I should be able to get hold of one of those tomorrow.

In reply to Lyndon, yes I am in the UK.

Steve: I will e-mail you RE the case.

Thanks for your help guys.
:-D
Michael.

I occasionally use Ghostscript to view PDF files and I would be thankful for
some help here, regarding a possible upgrade I should perhaps make.

I have what I downloaded as "GEMGS 1.3" but it doesn't quite match the
description given above- here the shell and ghostscript itself are integrated
into a single program, about 1.5MB in size, and upon starting, it declares
itself as Aladdin Ghostscript kernel 6.01. Is this something else? This
one has been compiled by Christian Felsch and the docs say it is based
on port of Version 3.53 by Tim Gallivan.

Now, would there be any
benefits if I upgrade:

* I am confused about version numbers (3.53 vs. 3.12). Is an upgrade
needed at all?
* Would a newer version still be usable on a 4MB MegaST? (the current
one just barely fits into the available memory).

* Are there any important improvements relative to what I already have?
* Would it possible to properly use it on a single-tasking OS?
* Would a new version be slower than the old one?
* Does v3.12 have GEM features of this GemGS that I already have-
windowed output and other stuff?
* Would perhaps the version in gs68881.zoo be optimum because I have the FPU?
If I understand correctly, V3.* does not exist compiled for 68000+68881?

Thanks in advance.

Me too, and Derryck had the same experience. A pity, because the
ST/FaST Club was very useful and helpful in the past, both with
their PD library and their Shareware and commercial stuff.

>drive??? I've never seen one before anyway...

Hi Michael

That sounds like the single-sided Chinon that was fitted to many
earliish STFMs, including the one I had.

>Anyway, to the change of drives. The old drive had different connections on
>the back of it to what I was expecting - there is a 14 pin single edge
>connector and a similar four pin connector. Theses were connected to a board
>under a shielded unit next to the drive - this board is marked "C100977 REV"
>and I assume it to be some sort of floppy controller, as it is connected to
>the motherboard by what appears to be the standard floppy drive ribbon and
>power cable - I removed these connectors from the board and plugged them
>into the sockets on the back of the Epson.

Yep - same as my original. The board is not a floppy controller as such
but an interface from the standard Shugart bus to the non-standard
Chinon connector.

>I've not tested the machine yet, as there was no power cable included and
>I'm reluctant to power up a set-up that is based entirely on guess-work.

Should be OK, but you may have to plug the Shugart connector in
upside down. It doesn't hurt to put it the wrong way up - but the
drive won't work in that case.

>Questions then:
>
>1) What is the C100977 REV board used for? Am I alright to disconnect it
>from the motherboard?

Interfacing and Yes.

>2) Am I correct to plug the (what appears to be) floppy drive cable and
>power cables from the C100977 REV into the Epson SMD-380?

From the *input* of the C100977 - Yes.

>3) If yes to the above two questions, is there any easy way to secure the
>drive to the bottom half of the case? The old drive was MUCH larger and the
>holes on the Epson do not match up correctly - it therefore seems inpossible
>to keep the smaller drive secured within the larger space that it occupies.

They should match in position, but the bottom of the drive has to
be moved upwards so that the disk slot matches that in the case (which
will probably neeed some modification to clear - use a craft
knife to carve out a bit from the top cover). I used small spacers for
mine - either brass or plastic will do. Note that there are only 3
screws - the fourth mounting hole uses a pillar with a pin on it
to locate in the mounting hole.

>4) Does anyone have an ST cover that will accommodate an SMD-380 drive that
>they would be willing to part with? The type that has a small
>parallelogram-shaped hole to accommodate the eject button. I'm reluctant to
>cut the case to allow the eject button to fit....

Go and do it!

Oh sure, throw in this non-standard bit of chaff here($), and that non-standard bit of dross there ($$) and pretty soon you find out why things like "Atari clones" cost a small fortune. Some sort of decoder here, and a bank-switcher there, and we're not talking about $300 retail any more.

And how much did that 192k card cost?

And how much would that translate into today's currency?

A 48k RAM expansion board for an Atari 400 retailed for $150, which in todays dollars would break this project before it got started.

Low volume, non-standard, high cost.

>Byron.

It's called "Market Research".

It's part of the process of finding out if there is already something
on the market at the same or lower price point.

If someone is already making something like "The Wonder Widget" and
selling it for half what it would cost YOU to make your version of a
Wonder Widget, it wouldn't make any sense for you to try to sell one,
and it wouldn't make any sense for anyone to finance your business.

If Gigahertz computers still cost $3000, it might make sense to try to
come up with a $300 computer that would do a lot of the same things.

Unfortunately, as some of the messages here have pointed out,
Gigahertz computers now cost as little as $350, making a "New"
computer based around some arcane, non-compatible, possibly obsolete
CPU chip, with no software available, and a user-unfriendly operating
system an awfully "hard sell" in the marketplace.

Companies like Atari, Amiga, Sinclair, (fill in the name of any one of
dozens of others) and even Apple have found out the hard way that just
having a "superior" box won't do any good at all if no one buys it.

The question is, who will buy this new $300 box?

So where on this planet do you live?

Check (as I said a few dozen messages ago) www.pricewatch.com
and find out how little a PIII Gigahertz SYSTEM really costs.

(Here's a hint: $418, INCLUDING Windows OS)

Or go for an Athlon Gigahertz for about $300 (again INCLUDING
Windows.)

A life is at your own discretion.

Ignore it, it'll go away eventually.

It actually DOES have relevance to the Atari 8-bit world, as the
inspiration for designing a new inexpensive system harkens back to the
venerable Atari Home Computers that brought "Power Without The Price"
to the few dozen people who ever bought one.

(and yes, I have an attic full of them myself)

There's a lot of nostalgia for the "simpler times" and the "simpler
machines" which populated them.

I get nostalgic every time I think about spending $550 for a floppy
disk drive.

Unfortunately I doubt anything is ever going to bring those times back
again.

But he mentioned 4-8 megs of RAM, which is VERY doable with a 68000, and the 64-256 as battery backedup RAM disk for documents. As RAM disk, the address lines aren't the issue. You can have 1 meg RAM disks with the Apple][+.

You didn't read what he said very carefully:

Hardware:
- 68000, about 10MHz
- 4MB to 8MB RAM
- ROM based OS (patched in RAM)
- 2 or 4 RS-232 ports
- 2 parallel ports
- an AD convert, with 4 inputs and 2 outputs
- 8"x4" LCD screen, high resolution,
high contrast, black and white is fine
- semi-portable design (something which can
be moved while I'm working, but not something
which I work on while moving)
- 64MB to 256MB RAM with battery backup, for
storing documents. Or use flash memory if
it is cheap enough.
- HD 3.5" floppy, for communicating with my
other machines

And, in his reply he said:

> Then throw in some sort of decoder for the 64-256MB chunk. Since
> it is not the main memory (that would be the 4MB chunk), it should

> not make much of a difference.
>

So, 4-8 as main memory, easily accessed by a CPU with 24 address lines,
and 64-256 battery backed RAM disk, which has little to do with address
lines.

68000, 80286 (or higher), or 65816 could do what he was thinking, as CPU.

This is true but the other memory is still memory and has to be accessed
in some manner. Plus we are talking about a sub-300 dollar machine
and any custom logic is going to cost money.

> 64-256 as battery backedup RAM disk for documents. As RAM disk, the

Oh really. You still have to get stuff in and out of your RAM disk and it
takes address lines. You will still need an address decoder to be able
to switch banks of RAM in and out of main memory. It doesn't happen
like magic. A real address in memory must somehow find its way
to the correct bank of RAM that you want to access. It is a real
pain in the butt doing it that way. The Apple II couldn't address
more than 64K or RAM at any one time anyway. Programs
never exceeded the size of memory space. The 68K is a totally
different animal. Programs can be huge on a 68k machine. I don't
think you would want to bank switch RAM to run a program.

If you want something all singing all dancing then even if I could design something better than a PC I haven't the time to write all the software to go with it.

If however you want to just make a computer for the satisfaction of saying "I made that" then I would make a clone of an antique home micro. The hardware design would be feasible, and you wouldn't have to write lots of software for it. The hardware could fit in fewer smaller parts than the originals, with modern memory chip sizes.

A few candidates would be:
ZX81 in PLDs or FPGA (done by Ian Bradbury and Bodo Wenzel respectively see http://www.howell1964.freeserve.co.uk/ZX81/ZX81.htm)
Commodore C64 in FPGA (done by Jeri: http://www.geocities.com/cm_easy/ - impressive!)
Acorn Atom / BBC micro / Atari 800XL / Atari ST / TRS80 / Spectrum in FPGA

Why not using 80386, then ? It has it all- MMU and segmented adressing, and one
even gets a several 100's bytes of cache ? ;o)

The older machine has 64 Mb of RAM. Maybe it needed just a trifle more.

But my point was that any OS that's specifically designed or customized to work with a very narrow range of hardware variation could be successful on these supposed $300 machines.

So using javac isn't real compilation either...? I'd say that it's real
compilation, just for a virtual machine.

> Perl also has separate compile and execute phases, although at present you
> have to do truly evil things to presuade it to spit out the byte-code.

:-)

> However, I think that that differentiation is bogus.

It definitely isn't a clear and /clean/ differentiation... and I did say
'roughly'. I don't expect to stick rigidly to that :-)

> It means that most implementations of Lisp are not programming languages.
> It means that if (god forbid!) you were to run C in an interpreter, it
> would not be a programming language.

Slight edit needed, I think: "is commonly separate" => "is or can be used as
a separate step"... and yes, I've seen a C interpreter...

Hi Rick,

Yup, a little ST mag, some Dungeon Master hintbooks, and the GEnie
Atari Roundtables.

Still checking in now and then to keep an eye on how things are going.

One thing I've found is that there aren't too many "old timers" around
any more that can answer some of the "I just got an ST for $25, and
the floppy drive won't work- How do I fix it?"" kind of questions.

Interesting to see the kinds of things this discussion is bringing up,
even if it's completely impractical. I guess if I really needed to
run 8-bit programs I could just make a trek up into my attic..!

I wouldn't be too surprised to see that. -

I just did a little poking around to check on prices of Motorola 68020
and 68030 CPUs, just to see how they would affect the cost of a $300
system.

Allied Electronics doesn't even stock them any more, but for only $200
they'll order you a 33Mhz 68020 chip.

That's almost THREE times the cost of a 1Ghz Athlon right now.

(And that's their QUANTITY pricing. Ouch!)

Supply and demand at work.

> Oh really.

Really. I have a 1 meg RAM card in my][+. There were a number of such cards sold. And some were battery backed. 16 address lines, 8 bit bus and 20 bit address space. Surely you have seen such in ads. And since that was done with an 8 bit 6502, I'm sure the 16/32 bit 68000 could do it too.

> You still have to get stuff in and out of your RAM disk and it
> takes address lines. You will still need an address decoder to be able
> to switch banks of RAM in and out of main memory.

RAM disks aren't part of your main memory. DUH!! Do you bother to read any of the posts being made? The software that organizes the RAM disk is in your memory, but as far as the CPU is concerned, that chunk of RAM is no different than a hard disk or floppy disk. Or do you wish to assure that disk drives are also part of the CPUs memory, being switched in and out?

> It doesn't happen
> like magic. A real address in memory must somehow find its way

> more than 64K or RAM at any one time anyway. Programs
> never exceeded the size of memory space.

Wrong! Programs often exceeded memory space. It was called overlaying. Ever hear of WordStar? And yes, that was a Z-80 program, but 6502 programs did the same thing. The overlays were on disk, called in to replace a part of memory (much like bank shifting, but much, much slower). With a RAM disk, exactly the same thing happened, only the data/code was stored in RAM outside the memory space of the CPU, and organized as a RAM disk.

The Coleco ADAM did this, so did the Atari 130 XE. There were plenty of boards like this for S-100 computers using the Intel 8080 or Zilog Z-80. In fact it was the best way to use CP/M Wordstar. Some would say, the ONLY way to use WordStar.

> The 68K is a totally
> different animal. Programs can be huge on a 68k machine. I don't
> think you would want to bank switch RAM to run a program.

No one was talking about bank switching.
He was talking about a 64-256meg battery backed RAM disk though.

Bob Retelle (bobr1@provide.net) wrote:
: The question is, who will buy this new $300 box?

Perhaps nobody. We are simply playing with ideas here.

Or, perhaps, somebody. Look at the groups this discussion is taking place in. How many people would even consider using these machines in an era of GHz computers? After all some of these machines run at a poky 1MHz, and are crippled by 8 bit wide words. (My Apple II fits in that category.)

Apparently a large number of us still use those machines. Some of us still buy those machines. Sometimes we pick up the original thing (Apples, Atari's, Commodores, and so forth) for a bargain. Sometimes we pickup devices which have similar, embedded processors. The TI graphing calculators use the Z80 and 68000 processors. These calculators appear to fit in the $80 to $220 Canadian range, and I'm willing to bet that there are good margins.

So maybe there is a market. But that still shouldn't prevent us from discussing ideas.

Byron.

1891. Re: WTD: DEGAS image

Here's how I found out about it: In Volume 1, Issue 8 of the Mister X comic series, the following reader correspondence appeared:

Sirs.
Recently I seem to have been seeing Mr. X appear on my Atari Computer
screen. The initials in the corner would seem to indicate it originated with Dean Motter. Is this correct?

Dean Motter (creator and editor of the series) responded:

You must have come across Batteries Included's D.E.G.A.S. graphic
software, for that is what the illustration was created for. For those who do not have an Atari ST at their disposal, we reproduce those graphics here.

The image was reproduced at about 2" by 1.5". There's a screenshot photo at http://www.atarimagazines.com/v4n10/stdegasart.html I'd like to obtain the actual image file, so I can do a bitwise conversion rather than the multigenerational mess I've got now.

Absent any leads on the image itself, I was planning on buying a used copy of DEGAS and copying the file directly to my PC, if possible. This was based on the assumption that the file is actually included with DEGAS. Since you say you haven't seen it even though you use DEGAS, I now have my doubts. Are you using the regular DEGAS or DEGAS Gold?

The disk-reading question is moot if I can't find the file, but . . . I don't need to be able to write to the disk at all, only to read from it. Do I understand you correctly that a PC floppy drive will read a disk that was intended for use on the ST? I don't have an ST at all, so any copying I do has
to be on the PC.

Thanks for your response, and thanks also to A. F. C. St. Clair.

This list was last updated on 07/04/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 4.00 Art & Film Director (Epyx) -- $5.15 shipping, due to
weight, counts as 1st item
$ 4.00 Death Sword (Epyx)
$ 4.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 4.00 Final Assault (Epyx)
$ 4.00 GFL Championship Football (Gamestar)
$ 4.00 Keith Van Eron's Pro Soccer (Microplay)
$ 4.00 Lands of Havoc (Antic Software)
$ 4.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 4.00 Metro Cross (U.S. Gold / Epyx)
$ 4.00 Paint Pro (Abacus Software)
$ 4.00 Quadralien (Spinnaker)
$ 4.00 Renegade (Taito)
$ 4.00 SwiftaR (Accustar)
$ 4.00 Techno Cop (U.S. Gold / Epyx)

$ 4.00 Warship (Strategic Simulations, Inc.)
$ 4.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 4.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 4.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 4.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 4.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 4.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 9.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.15 shipping, due to weight, counts as 1st item

$ 9.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 9.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 9.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 9.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 9.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 9.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.15
shipping, due to weight, counts as 1st item

$ 9.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.20 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

That price is insane, and I suggest that you shop around more. And focus on the 68000, which I have seen in calculators costing about US$120. I am quite confident that the manufacturer is not producing these at a loss, and likely have a healthy margin. One of these calculators served as my inspiration, only with boosted I/O capabilities, much more open design, and with the OS in ROM where it can not be damaged. (I pulled mine apart, and it used a Motorola 68000.)

I will not argue withthe PB100 hypothesis though, as I am a Mac user.

It is worth noting though that only parts of the Macintosh and IIgs operating systems are in ROM. For the machine to be in a useable form, the rest must be loaded from disk (the Classic was an exception, but even it does not spring to life as an Atari ST would). Indeed certain drivers required to access the original Macintosh hardware do not appear to be in ROM, including part of the serial driver, the print manager, and the AppleTalk manager. (From Inside Macintosh Vol. I.) details are bound to be different for later models, such as the PB100, but I would imagine that (proportionally) less was integrated into later versions of the ROM.

Now why is that relevant? Well, I would want the whole OS in ROM. That way, if you goof up while creating patches, you simply reset the machine (or, better yet, disable patches while booting in order to recover your data). This calc of mine (with the OS in flash memory) has given me a scare a couple of times, and certain parts of its software do not appear to work correctly to this day. It is, of course, poorly documented so that is a problem too. Hopefully the ROM would be socketed, so that the OS could be upgraded (or the patches incorporated in some optimised form).* But that is not a huge issue. The other reason for a ROM based OS is to avoid the lengthly process of reinstalling the OS, as I'm certain many of you Windows users enjoy. ;-) The patches would have to be reinstalled, but your machine wouldn't be in an unusable form without them. If the patch installation system is sensible, they should be quite easy to copy from a floppy disk to a system folder anyway.

Byron.

[*] Come to think of it, wouldn't flash memory have a write enable line? If so, a manual switch or jumper on this line would be a suitable alternative.

> in the butt.

I did say that they would have to be bank switched. It would still
need an address range to move the data to like that extra 64K on
the 80 column IIe card does. It is bank switched. What I meant
in saying they didn't exceed the size of memory was that only
64K could be accessed at one time. To get more memory requires
the programmer to bank switch the program or to swap code
out and pull it from the Floppy/HD in his code. No hardware
or OS automatically handled that on the Apple II. The early
PC's like the 286 had all kinds of odd ball memory due to the
8-bit legacy of the 286 processor. They still had 64K code
segments and any one chunk of code had to reside on a 64K
bank. You don't want to place a loop on two banks of memory
because that would require you to bank switch constantly.

> For software like a RAMdisk, it's not a pain in the butt at all to use
> bank selection. No different from selecting what sector of a disk drive
> to read in a driver for an ordinary electromechanical disk.

While that is true, it requires special coding on the part of the
program. Not all Apple IIe programs supported the extra RAM
and it was the minority that did. The program had to be aware
of the memory. Some smarter 8-bits using the 6809, had a
MTU unit which would take care of the bank switching. They
had a smart operating system called OS-9 that knew how to
handle the memory plus it had a hardware chip which handled
a lot of the memory management.

The other way was using the Chain command in the older
basics which would remove the app in memory and load
the referenced code. Not all Basics had that command. That
made it a bit easier but on the Coco, it required the programmer
to write routines to access the memory. It was not handled

automatically by the OS.

Sorry. It only works on Ataris and clones with at least 68030 cpu and
256 color mode available. It works very stable at least for playing
games but what it lacks seems to be people that are interested in
using it.
For a good emulator usable on a 68000 machine you will have to wait
until Christian Krueger eventually releases his emulator that's
based on Atari800 but is a complete rewrite with most (or all ?)
of the code in assembler. But I think it will need at least several
month until he will be able to release the first version.

1898. Displaying other charsets

Newsgroup: comp.sys.atari.st
Date: 2001-07-17 07:58:50 UTC
From: Denis Huguet <claude1@d1.fr>
Message-ID: <3B53F0DA.E89D05F8@d1.fr>
Source record: 43569

Is it possible to display characters in some charsets like Shift-JIS
where a character can be more than 1 byte long ? Does NVDI5 allow such a
thing with an appropriate font ? If so, can it be done transparently
done by GEM or does it have to be done through some specific VDI calls ?

Thanks.

>I have what I downloaded as "GEMGS 1.3" but it doesn't quite match the
>description given above- here the shell and ghostscript itself are
>integrated

Take a look at the readme from the latest version (that's the one you've
downloaded). AFAICR the Atari versions on the Godel site are old.

[Snip]

Development history from ST-GS 3.54 up to GEMGS 1.0

- Screen redraw at start-up removed.
- File selection *.PS -> *.*ps (Freedom can do this, but others??).
- stgs.rc -> gemgs.cfg.
- Load Config: The EnvVariables entered in the file will be used as well!
WARNING: These variables must be set correctly in an editor, as, if
GEMGS does not find gs_init.ps, it has no opportunity to open
a dialog!
- Position of the page selection dialog will be saved.
- Evaluates AP_TERM as well and reports this to the AES.
- Output only possible to a window now (previously also direct to the
screen).
- Temp files are really saved to $TMPDIR.
- Resource farmed out as a separate file.
- Menu shortcuts now work. The Help function is called by pressing the
left [Shift] key.
- CEN: removed. Printing now only via PRN:
- Ghost understands VA_START. - There is only one menu entry left:
'Open file'. An Open Page is attempted first; if this misfires (e.g.
with eps) the file is opened normally. The problem with this is that it
only works if the document is opened via the menu or VA_START.
If one specifies a file as an argument at the start, one cannot
perform an Open Page as the interpreter reads the file immediately,
before the Atari driver can do anything about it!
Remedy: Possibly a small program that is installed on the
desktop to start Ghost and then passes the argument via
VA_START. This would also allow new options (e.g. --no-gem).
If a file is not opened as Open Page (e.g. PDF) the interpreter has
to work its way through the complete file first - in other words
display all pages before the next document can be read!
- True iconify.
- Solution for the problem with its own parameters:

The Atari driver first of all is passed all the parameters, filters
out its own and passes the rest on to the interpreter.
Hence there is a new option now "--no-gem" for switching off the
GEM interface (e.g. because one wishes to print).
GS_WIN will NO LONGER be paid attention to!
- Various things adopted from the CFLib: Nicelines in the menu, UserDefs.
- All dialogs revised: UserDefs, only OK and Cancel remain.
- All possible printer drivers and file formats made available in dialog.
- If gemgs is started with just one file as argument, the Atari Arg-filter
extracts this and then sends a VA_START message to itself. This makes it
possible now for Open Page to work also for files passed at start-up!

- New gs kernel 5.01 -> 5.03
- Stack size reduced to 50K. That's quite enough!
- Some corrections to the USERDEFs.
- With multi-page documents the page number appears in the title bar.
- Page-wise browsing through document with Return/Enter/+ or Backspace/-.
- Now fully converted to CFLib.
- Dialogs revised: All options (Device/Format/DPI) selectable via popups.
- If argv[0] = 'gs' (e.g. /usr/bin/gs is a link to gemgs.gtp) or Option
'-h' is specified (e.g. to display the list of printers), gemgs will be
started without GEM.
- Menu entry 'Reopen'.
- The font ID and size for the Console and Help windows can be set in the
Config.
- If <name>.pdf is opened, GEMGS attempts to establish the number of pages
and creates the file <name>.ps in the same directory, which is then
processed. This new PS file does NOT contain the PDF document, but only
the information about all the pages!
- Position of the dialogs is no longer saved -> always centred.
- German resource file (in the German version - English translation by
Derryck Croker in the UK release).
- HELP removed.
- Page select dialog removed, replaced by a popup following a right-click
in the Console or Document windows.
- A backup is no longer created for the CFG file.
- The right mouse button (in Console or Document windows) brings up a
popup making functions for loading and browsing through the pages
available.

- New gs kernel 5.03 -> 5.10.
Includes appreciably more printer drivers. The following output devices
are now present:
Screen: stvdi
Printers: bj10e, bj200, bjc600, bjc800, cdj500, cdj550, deskjet,
djet500, epson, laserjet, ljet2p, ljet3, ljet4,
ljetplus, lq850, necp6, slm, st800, stcolor.
File formats: epswrite, gemimg, jpeg, jpeggray, pdfwrite, png16,
png16m, png256, pnggray, pngmono, pswrite, tiff12nc,
tiff24nc, tifflzw, tiffpack.

- Converted to CF-Lib 7.
- Output dialog redesigned.
- Keyboard evaluation of the graphic window reinstated.
- New Copyright dialog with separate version indication for GEMGS and interpreter.
- Reload corrected: If page 5 was active, it will also be after a reload.
- An ST version is now also available (e.g. for MagiCMac).

Version 1.0 Published 06.08.1998

- Due to an error in the GEM-Lib, 1.0 did not run in colour :-(

Version 1.1 12.08.1998

- RSC versions check
- Added free choice of Y-resolution, with which one may now use unequal X and Y resolutions (e.g. 360x180)
- GS_DISPLAY incorporated in CFG (see docs!)
- English RSC by Derryck Croker
- English text by Peter West
- French RSC/Lisezmoi by Didier Briel

Version 1.2 03.01.1999

- New gs kernel 5.50, new Libs
- SLM-driver now uses only ST-RAM. Will that help?
- Fileselector comes up with *.* instead of *.*ps
- If -dNODSIPLAY is set, gemgs behaves as if '--no-gem' is also set, i.e. it runs without GEM and makes no (graphics) output (e.g. for PDF-extract)
- Small tool (pdf2ps), that extracts page infos from a PDF file

-- Christian Felsch stops any further development --

-- Christian Felsch can't leave :-) --

Version 1.3 25.03.2000

- Newer gs kernal 6.01, Current Atari-Libs
- new laser printer driver: cljet5, cljet5c, fs600, lj5mono, lj5gray, pxlmono, pxlcolor

IIRC that boardhas two chips on it: one is Intel's 8048 (40 pin DIP
microcontroller),
and second is just buffer/ something like 7406.

Whole PCB serves the purpose of covering defficiencies of old drives that
Tramile has found god knows where.

If you want to do it anyway, and connector from the board to the drive
itself is not compatible, then you should
find the pinout of the standard floppy, pinout of the ST's floppy connector
(that 17-pin round thing), fscavenge somewhere PC's floppy flat cable and
wire it accordingly on the cable signals. Best is to cut all the traces that
go to the schips on the PCB and to pull both chips out, since you don't need
them for new floppies. Take care when wirng power/ don't mix up 5 and 12V
power !

To my knowledge there is not support for multibyte character sets in any
program for the Atari.

Allereerst,

Sorry for posting in dutch, but this HW must be collected.

Heb hier staan een:

Atari MEGAST2
Atari Megafile60
Monitor Atari SM124

Nog een extra atari monitor in doos. (geen verdere gegevens, staat ergens achter)

Gratis af te halen door een echte liefhebber.

Af te halen in koewacht (stekene), belgie.

PS. Weg wegens plaats/tijd gebrek. Spectrum en C64/128 gerelqteerde spulletjes als eventuele ruil zijn welkom, maar dit hoeft echt niet.

Alvast bedankt.

Johan

Hi Lonny,

>If the Hades had a lower price tag everybody and their brother would
>have one. I don't get the "specific apps" for these machines arguement.
>It's a price issue, always has been. You hit the right price and it
>would not matter what apps are out there it would sell.
Here in Europe a very basic PC costs about the same as a Milan, the cheapest iMac costs about 25% more then a Milan... someone buying a computer today to surf the net, play games, watch a DVD film, create MP3 in real time, do some stuff with an office suite and a thousand other things... Even if you would give away the Hades and Milan for free, they wouldn't touch them with a crowbar. Why did Apple survive while Atari and Commodore went under? not because they build better machines and most certainly not because they sold them at the right price... the answer is a very simple one: available apps

Hi Janez,

>He said that its not true noone wants Hades/Milan (he has Hades, we have
>Milan), he said its not cheap so ppl dont affordit widely, but machines
>still sells
How much did you pay for your first Atari ST which probably came without a harddisk? do you remember the price of a MegaST back in 1987 not to mention the TT in 1991? The price for a Falcon in 1993 was daylight robbery. Viewed in that light the Hades and Milan are bargains. I know that the times have changed, but this is the Atari platform... anyone looking for a cheap tower is on the wrong platform.
Suppose someone would upgrade his Falcon with vapourware like the CT-60, a graphic card, ethernet Romport adapter, more memory and a reasonable big hardisk... is your calculator working? It'll cost him more then a *brandnew* clone, and although he will have spend a lot of money he's still stuck with a machine that isn't expandable and will be a lot slower then the clones. Slow harddisk and CD-R access, slow ethernet etc... if that guy has any sense at all he'll put the Falcon in the cupboard and get himself a Milan or Hades. But we both know that's not going to happen... he's not going to buy a clone because of various reasons like: too slow, all German docs and soft, no specific software, not available at the cornershop etc...

>And about Amiga: he statet that he seen Java working on Amiga 030 (50mhz
>ACC) as so there is NO reason it couldnt be done on 030/040/060 Ataris..
There is a Atari browser which can do Javascript... Adamas Pro, and if the rumours are true we should see an update within the next two weeks...

>Last world: in 800XL scene, same ppl (say stupid, dreamers, off
>reality) did preemptive mtasking os, scsi drivers, RAM expansions,
>accelerators.. Iwe seen such machines, all i can say is, im amazed, i
>respect those guys a LOT!
There's an enormous difference between the XL/XE scene and this platform, comparing the two is like comparing apples with pears. A typical average ST/TT/Falcon user has upgraded his computer with more RAM, a CD-R and a bigger harddisk. Only a very small group has spend money on an accelerator and when talking ethernet, graphic cards or cd-writers, we're talking about individuals... this is the only platform of which the users turn a blind eye to innovative stuff. Have you asked yourself the question why the CT-2, AB-40, Nova cards and various memory upgrades aren't produced anymore? At the time they were available, hardly anyone was interested... If the XL/XE users would have the same attitude... they still would be working on a basic 64Kb machine and cassette recorder.

If you really want tocomparisation, let's compare this platform with the Amiga platform.... an Amiga user never was able to buy a clone. If the Milan and Hades would be Amiga clones, they would sell like hot cakes...

Cheers from Belgium
Dennis

This may sound harsh, but what is keeping Atari development back is to a great extent the hardware. Even if the developers might have a Milan or Hades, the users tend to expect it to run fine on an ST, or at least on a not very expanded Falcon.
Yes, the clones are expensive, and they're not getting cheaper by not being bought. Nevertheless, you have to make a commitment. Is the Atari just a toy, or are you serious about your choice of platform? In that case, your bank account should be serious about it, too.
A lot of you have got a PC or a Mac somewhere in your house. Obviously, you've bought that instead of the Milan. That doesn't sound like much of a commitment. You expect your 1993 hardware to keep running whilst happily throwing dozens or hundreds of megs of RAM and equal amounts of MHz on Windows or Mac systems. By doing so, you're reducing your Atari to a mere toy, whilst moving more and more of your computing tasks onto the alien platform.
I think a lot of developers would be happy not to have to actively support single-tasking machines from the 1980s, and I think you'd be a lot happier, too, if you upgraded. But upgrade within the Atari world, not out of it!

Besides, I don't buy that argument about Clones being expensive. The Milan mobo costs around 500 EUR, IIRC. It's not very hot compared to that iMac over there, but it's a bloody fast Atari system, and that should be enough of a selling argument.

Do you mean Unicode? papyrus can display and use the extra characters which
can sometimes be found in TrueType fonts. I think NVDI is required for this.

What he's saying is that if the Amiga can do it, the Atari can as well. It
should, since few platforms have been so similar.
It's obvious that Lonny prefers the Atari, applications or otherwise.

All right, Dennis, I'm all for paying for one's software, but even I am having a hard time rationalising paying for a product whose developers have once and for all fled the Atari platform and which has not been developed for over a year. Why pay for CAB? It's like a really bad relationship, where one partner remains true to the other, despite the fact that he's already run away with another boy.
People not being prepared to pay for HDDriver, that's a shame. People not being prepared to pay for MagiC, that's a shame. People not being prepared to pay for a dead CAB, that's an entirely different matter.

Okay ... Thanks for all your help so far :)

I now have Stik, MultiTOS, HSModem and QDialer installed and working.. only problem i have is that when I go to dial, the modem remains lifeless. No lights, noises, nothing. Its as if the system is look at the wring serial port (even tho I only have ONE serial port on my ST !)

Sorry if i'm being stupid, but ive never used the internet on the ST, the only comms I have done is Terminal connections using Vanterm :)

HUGE thanks to all who are helping me !!

Regards,
Jon Gibbins

I guess Denis does not refer to Unicode but rather multibyte codesets
where each character can have a variable length, not a fixed length like
Unicode. Shift-JIS is a codeset of its own.

Sometimes one's thoughts and what one types aren't always the same. Perhaps that is why your last sentence is nonsense. Many programs for 64K 8 bit computers were larger than 64K. Some 8 bit machines used bank switching, some used overlays, and some used both (WordPerfect for the 128K ProDOS Apple //e or //c would run MUCH faster if one added extra memory and formatted it as a disk drive, copied the files to the RAM disk and launched the program from the RAM disk. Neither ProDOS nor WordPerfect did any "bankswitching", only the loading of overlays from a disk.

> To get more memory requires
> the programmer to bank switch the program or to swap code
> out and pull it from the Floppy/HD in his code. No hardware

But then, the machine that you protest would cost too much would easily do that. As I recall the 128K Mac used "virtual memory". Was that the ability of the 68000, or the OS, or both? And why couldn't it be done on this machine inexpensively?

> The early
> PC's like the 286

The early PCs, of course, used 8088 and 8086 chips.
The second generation, "Advanced Technology" machines used their 286 and later 386 CPUs as fast 8088/86s.

> had all kinds of odd ball memory due to the

Of course, you have the same situation with the IIgs, because the 65816 has
segmented memory.

No, it doesn't. It only requires RAM disk software. *IF* by special, you mean
the ability to use a RAM disk as opposed to a floppy disk or hard disk.
Again, overlays were VERY common in the late 70's and early 80's. Memory cost
too much, so programers had to use disk space. Besides, you have shifted the
point. You said the problem with his machine was very expensive additional
hardware. Nothing about additional code.

None of the above however deals with the erroneous conclusion that 64-256meg
of RAM disk would require expensive additional hardware to use with a 68000
CPU.

Oh, they are. The 80186 is also still rather popular (it pops up
quite a lot in cheap disk controllers and the like, and consumer
appliances - my fridge has one for no reason that I can fathom). Even
the 6502 and Z80 are still being manufactured for use in embedded
systems.

>You need to find someone who can print it for you so you know what the
>Word doc looks like.
>

I have encountered some problems when converting Word Docs with
Papyrus.

It often produces an error dialog that says something about failing to find
"Times New Roman.e24"

I have found that I can drag&drop the word doc onto the conversion
TTP. This produces an RTF that cannot be opened for the same reason
but I then use a text editor to change the Times New Roman entries
to Life.

I have checked the font directory at this .E24 file definately exists
so I am not sure what the problem is.

Has anyone else experienced this ?

Regards,

Peter

Sounds like a good idea but where can I get hold of a hardware upgrade ?
Surely people are no longer manufacturing these upgrades ..? Ideally I
would
like to upgrade the Mega to as high as version of TOS as possible. TOS v1.02
also refuses to run most of the (brilliantly impressive) megademos I happen
to
own copies of (such as Cor Blimey What a Scorcher, the Vodka demo and
Syntax Terror) ...

How come it was dayligh robbery? I payed my falcon 2200dm in late
93! For computer which had DSP, 16bit 50 khz audio, up to 8 channels with
realtime effects. With kinda ST compatibilty, which soon got apps like
Apex media etc.. At that time 386 costed arround 2000dm.. Sound card with
only NEAR such specs were astronomicaly expensive... Also i use that
machine from that date till today, meantime i did invest in Ct2 and thats
all (hdd, monitor is kinda "usual things".. PC owner did upgrade later to
486, Pentium bla bla, end eventualy got more powerfull machine.. Still is
that more fun machine?

Please, do not give me that, u intentionaly wana make me dumb or
what? Atari is fun machine i love a LOT.. FUN does NOT equal SPEED! My
crewmate has Milan and neither me or him has serious speed problems and
remarks! For me Atari aint GEM only, as i type this i listen to SID's,
well Milan is mute, Hades is less mute, i use Neon quite a lot, ApexMedia
a LOT. If u dont care for those app is your problem.. I wana use them! I
wont participate here anymore! Simple reason: No matter how i turn my
reply, u somehow came to speed and falcons/orignal atari slowness. And im
telling this for the last time: Our apps are smaller, so slower hdd dont
means hours of waiting.. Same for memory access. Falcon (esp with let say
ct60/pci where u may enjoy VIDEL/PCI gfx double monitor system) can run
ALL absolutely ALL what Hades/Milan can, speed depends on accelerator (one
info for u: my ct2 falcon loads jpg via DSP (aniplay) a fraction faster as
Hades 060, altough hades did dither to 256c). Opposite that doesnt
count. I can name u A LOT of examples what Falcon CAN do, clones will
fail! Lotsa of those are really really good and powerfull apps! (incoming
ACE, CAF, ApexMedia, ESCPaint, Mp2 (uses 0% cpu time), Mp3 (uses 18% on

ct2). Some are essential abilites i want, such as VIDEL graphics (i use 960*744 in 256/16c and 720*4560Tc) which aint fastest, but VERY flexible, allows virtual consoles (with ct60/pci, nova card u may have vcons on VIDEL and Desktop on gfx card at same time), res changing in moment etc etc.. Its not all just in pixel size! I could go forewer.. Power and speed is NOT all! Felling matters.. for better example: Ferrari and truck has both 300HP, does that makes them equal? I did buy CT2 yes, im not immune to speed boosters, still main reason was FastRAM (i run crapy Unix so need RAM) and also CT2 is allround accelerator, its fairly (very well infact) compatible and accelerate all board and gfx (cpu+bus+videl+fpu+dsp and adds ram), not just CPU and even that on account of loosing a LOT of compatibility.

In short: I love Ataris, apps and feeling! Im not overhelmed and excited on bloody specs only! I NEVER regreted any penny is spent on Ataris and im convinced that PC user spent a LOT more as i did from 85 till today, 80% of his money was spent just to be "in" with new app versions and work in Word is not much quicker as it was few yrs ago, CPU's are faster a lot.

> Slow harddisk and CD-R access, slow ethernet etc... if that guy has any

> Hades. But we both know that's not going to happen... he's not going to buy
> a clone because of various reasons like: too slow, all German docs and soft,
> no specific software, not available at the cornershop etc...

Im sorry i have no sense.. Im still on Falcon, using TT as server with IP masking, use etherent (well crawly 1Mbit riebl) and cable connection for few years. TT is early model with cpu daughterboard and riebl is dated 1990.. But it works.. HDD acces? are u joking? I load Papyrus FASTER as my pal Word.. whats the use of faster HDD if app is 10 times bigger?

>
> >And about Amiga: he statet that he seen Java working on Amiga 030 (50mhz

javascript aint Java.. Did u actualy try Adamas? Its super stable, survive some 1-5mins till it crash.. Its good try, still not usable with such record...

> There's an enormous difference between the XL/XE scene and this platform,

> basic 64Kb machine and cassette recorder.

Wrong! XL is alive today because user who LIKE the machine, they dont moan and cry, they do things.. They do use PC or MAC etc, but didnt toss their machines as u said in cupboard, they develop it.. so XL is NOT dead. ST/Falcon scene is similar. I was at EIL2, 80 ppl from whole Europe, super guys, no moaning and crying, just super guys, friendship and ATARI all the way! Get Falcon and check yourself "hmmm" demo, ull see what this crapy, slow machine can do! (plain 4mb falcon will do!) And check new ST demos and ull see what ST can do! Incase u wonder what IDIOT still use ST these days: NASA uses them, and in process of testing the ETA sailplane wing (most hitech and best sailplane of today) MegaST is used. (saw that with my own eyes, few weeks back on TV). Wings are wiggled and shaked and lotsa mesuring points and laser interferometry detectors were coupled to ST..

> If you really want tocomparisation, let's compare this platform with the
> Amiga platform.... an Amiga user never was able to buy a clone. If the Milan
> and Hades would be Amiga clones, they would sell like hot cakes...

U think so? Ask Amiga ppl, if Hades would be Amiga clone, and only pure OS stuff would work, so no hmmm "non workbench, sorry amiga ppl dont know how to say, apps which dont use OS), NO music apps, no demos, no intros, no games at all would run, how many ppl would buy it? Remeber probs with a1000, a500, a600, a1200 caused by incompatibility? That effectively killed the Amiga imho...

Janez

P.S. I repeat: Im not against clones at all, Hades/Milan aint bad machine, for compatible that is.. But i still like Atari feeling, i want clones would still have some compatibility, id like ppl wouldnt just see damn MHZ/Pixels.. Its so damn narrowminded! I clearly see now, i dont belong here, i may be old fool whatewer u may call that, but i do have my view and im not obligated to defend it to anyone.. Time will show, but remember, c64, XL/XE are stil alive, but cause of those who love their machines...

I think I'd rather buy from auction something cool with my US$300,
like a used SGI workstation. So long as Winblows doesn't appear on
the monitor I'll be happy spending that on a used machine...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hubble Space Telescope also uses 80386 (or maybe it is '486). AFAIK for such applications special radiation-resistant versions are used, running at reliable 20MHz or so.

If I may say so, MultiTOS does not seem to be an optimum setup for an
8MHz/4MB computer. It would slow everything to almost unbearable levels.
Stik, HSmodem and QDialer would work without MultiTOS, and if you need
multitasking, Magic or Geneva are better suited to this computer 'size'.
Consider MultiTOS and Mint in general if you switch to, say, a Falcon
or a TT.

On the other hand, NVDI would be very beneficial to your computer, as
well as (quite good) TOS2.06 (TOS images can be found on the net and they can one can
be loaded into RAM). With all extensions, Stik, etc. installed, you should
have more than 2MB left on your 4MB computer. As for internet applications,
Newsie is free and usable (e-mail, news, ftp) and Cab2.8 demo browser is also
quite operational.

Yes, but not an old power-hungry monster like Megafile. However, some
more modern drive with smaller power consumption (and smaller size)
would fit nicely, heat less, and there is an ACSI connector inside
the box so the ASCI/SCSI host adaptor can be put in there too.
Remember that some ventilation has to be maintained so it would not be
good to jam the box full of additional hardware.

Bob Retelle <bobr1@provide.net>

: >I'm not subscribing to csa8bit to receive all those info I don't want to
: >read.

: Ignore it, it'll go away eventually.

I surely hope so...

: It actually DOES have relevance to the Atari 8-bit world,

Well, *some* msg's in the thread have a little bit Atari 8-bit related stuff in them. Unfortunately, many of them don't have any at all (notice all the crosspost info). The topic is now more about how much memory you can control with an 68xxx CPU, which has absolutely nothing to do with an 8-bit Atari...

: I get nostalgic every time I think about spending $550 for a floppy
: disk drive.

Time hasn't changed. The 1050 was state of the art in those days. About the same when you go out to buy a good DVD rewriter for the Wintels. Same price, same state of the art, and virtually no value when it's 15 years old. Some people will get nostalgic at the time it hasn't any value anymore, others may still use it, like I use my 1050 drive right now...

I don't get nostalgic when I use my Atari 130XE to program some things or what, or take a look at my BBS. This is cause my systems are used about every day or so. I get more nostalgic when joining an Atari 8-bit meeting, with a room full of 8-bitters that are actually used and not owned by people who keep them just for nostalgic reasons and use another computer to emulate the thing.

I don't say it's wrong to collect for nostalgic reasons or use an emulator. It's just that about every topic is about emulators and .ATR images, about how to convert them, how to format them, or how to build a "better" new computer, how to emulate this, how to emulate that, etc. What's wrong with the original Atari 8-bit hardware? Many people seem to forget there was a thing *before* the emulators, namely a real computer...

Don't get me wrong. I also have Pentiums laying around, and am using A.P.E. to transfer ATR images if I need to, but rather talk about the 8-bit side of the SIO2PC interface in stead of the other end of the cable...

My $0.02

Hi STeve!

Not really - he is using a borrowed machine (very long term loan, but not his property). But if it were a memory shortage, would it load OK in mono, with Sebra running as well (which it does)? I doubt whether CAB uses more memory in colour than mono for itself - of course it will when loaded with docs and images, but as I said it didn't get as far as that. I don't think he had WDIALOG, but am not sure whether CAB 1.5 needed that. And in any case, why OK in mono but not colour?

1939. Falcon and Alternatives to Cubase Audio

Newsgroup: comp.sys.atari.st
Date: 2001-07-17 23:27:20 UTC
From: nurmix@spam-free.com
Message-ID: <3b54c492.4212351@news-server.socal.rr.com>
Source record: 43511

Ok, I've been using Cubase Audio for quite some time, and it's been discussed here in the past many times (by myself, and others like Brian Becroft), but I seem to be having more and more problems with CAF's little "pops/clicks/random noises in recorded tracks" BUG lately. It seems like it never used to be quite this bad, but lately it's really causing major trouble in my studio with vocal tracks I've been trying to record (ie: a vocalist nails a perfect take for the fifth time, and you have to tell him/her: "ahhh, sorry, there's one of those random POPs in the track... can you do it one more time please?").

It's more or less unusable to me (although the MIDI portion is still ok). And yes, I've had the Falcon audio fixes performed on my machine back when I got it in 1995. And just to let you know, I record through the FDI via my Tascam DAT's converters. And my Falcon also has the Nemesis accelerator in it.

Now, I've used the Centek "Studio Son" software, and it records without problems (except for the occasional bit of noise at the end of a track - which can be easily CUT out), and seems very stable. However, e-mails to the authors either don't go through, or are unanswered. And I'm no longer able to find any information about this program on the web (except for an old review or two), and without a manual, many of it's features and functions remain a mystery to me. And I've no idea how good it's multitrack capabilities are since this feature is disabled in the version I have. Does anyone know anything more about this program? Is the commercial version still available? Anyone have it?

I've also tried QUiNCY, but is not useful to me as I need to record through the FDI.

Is there _any other_ multitrack/digital recording software for the Falcon that does at least 8 tracks, can utilize the FDI for recording, and doesn't suffer from these BUGS in Cubase Audio? (an additional plus would be the ability to also playback MIDI in sync with the recorded audio tracks).

For the past couple of years, I got out of using my Falcon for "everything", and relegated it to only music chores in my studio (I built myself a PC for everything else). And if I can't find something soon, I'm going to have to replace the Falcon with yet another PC (I'll build it specifically for music/MIDI - probably running Cubase VST or Pro Tools)

Any suggestions? I'd like to keep using the Falcon.

Source record: 43512

Neil finished a new Beta version of PULSAR. We are now up to version 2.0!

Get it here:

http://sites.netscape.net/timconrardy/pulsar.htm

Here is the revision history for ver 2.0 Beta from Neils History TXT.

2.0 June - July 2001 Major Internal Revision Beta version whilst testing Changed velocity values to real numbers, instead of FF, F, Mf... PP as before.

Added facility to load DEFAULT.PUL on programme start

Changed the whole way the programme works internally, from polling the system 200Hz timer to being interrupt driven - involved learning some assembler, and some help from various members of the atari programmers newsgroup - THANKS!

Looks like some features were added. Using velocity numbers is much easier to work with as well as having a default file that will autoload everytime you boot up Pulsar!

We would appreciate any feedback on this Beta version!

Tim C.

Tims Atari Midi World

^^^^^^^^^^^^^^^^^^^^
> because the OS dont offer services/drivers I do see a problem using it for a mainstream home OS.
> Do you think linux is not on everyone computer because of marketing only?!?!?

Um, you're using XP... You're whole operating system IS beta.

Anyway, it's the hardware manufacturers job to provide drivers, not the OS. Any hardware worth having works in linux for the most part.

You don't NEED to recompile linux, some people do because they CAN, with linux you have that option. With windows you must upgrade or format and reload to implement new features. I didn't need to recompile linux to support ICS, but I did need a new copy of windows. I didn't need to reload linux to support fat32. but I did need to upgrade to rev-b95 windows. Same goes for USB, with windows you had to replace the whole OS to get that functionality. Firewire, ect, same thing there... you were saying?

And yes, the biggest reason people use windows is marketing, it comes with the computer. XP is nice, I'm using it right now (RC1 2505), but I wouldn't trust it to the extent I trust my Progeny Debian box. Heck I wouldn't even have it if it wern't for this MSDN subscription (another thing MS did right).

The only technical superiority Microsoft Windows has over Linux is the Gaming SDK/DirectX, which is incredibly good. No matter how much someone likes to bash M$, they still have to agree.

Your/My Win XP doesn't support 64bit, so again here comes an upgrade and/or format and reinstall. not on my Linux box! Rumor has it XP doesnt handle 64bit PCI very well either (was looking at that dual athlon board). In learned MS fashion, we "need a newer version"

Ah... is that a full version with all the address and data lines,
or is it a "stripped down" version for embedded applications with
those extra bits on the chips?

I checked the "usual sources" but didn't turn up anyone who stocked
'386s any more.

It was a similar type of hardware in that it was produced in very low
volume and had no "standardized" parts in it, thus the individual
retail price was very high.

(Of course, in those days there really was little that could be called
"standardized", I admit.)

Most of the suggestions proposed here have been great from the "gee
whiz" neato aspect, but I really doubt they could be realized for the
target price, especially considering the overall sales are undoubtedly
going to be very small.

That would be great, of course. Those features don't seem to have
been very widely considered though, considering many of the
suggestions so far.

Well, Newark Electronics has the slower 20Mhz version of the 68020 for only about $65 each, but they only have 65 of them in stock.

I checked the 68020 and 68030 because those were suggested in several of the messages discussing Memory Management.

The 68000 requires an external MMU, taking up more real estate on the motherboard and adding cost to the basic cost of the CPU.

Having lived through the "OS in ROM" with the Atari ST, it can be a "double edged sword". It WAS great to have the OS boot almost as

fast as you could blink.

Unfortunately though, if there were any bugs in the code, (HA.. IF)
you were stuck with them until the manufacturer could get around to
first finding them, then fixing them, then finally producing a new
version, then distributing them, then finally you get to open your
machine and manually replace them.

With Atari, that manufacturing cycle took about as long as the useful
life of the computer. It's far more difficult than releasing a
"service pack" on disk.

And, the cost to the end user was ridiculous.

(Of course, it DID generate a nice little "cottage industry" for
programmers to come up with fixes and patches while waiting for the
"official" ROMS to finally appear.)

Do you really want "Mom and Pop" $300 computer buyers to have to be
prying ROMs out of sockets and jamming new ones in?

Actually what I always thought Atari should have done with the ST was
to put the OS on a cartridge. That way they could issue updates which
could be swapped as easily as changing a game, and the old cartridges
could be returned in the same shipping box for a credit. Sort of like
deposit soda bottles.

Only problem is, it would add $$$ to the cost of the original unit.

(Cartridge shells, cartridge pc boards, sockets, bypass capacitors,
possibly buffer chips, EPROMs, socket for the motherboard, tooling for
the computer case, etc.)

When we would suggest improvements in the ST, Atari would whine about
the cost. For example, sockets for the memory would have made RAM
upgrades very simple, but they told us that would add $25 to the
overall cost of the original computer, so sockets were out.

>
>Byron.
>
>[*] Come to think of it, wouldn't flash memory have a write enable line? If
>so, a manual switch or jumper on this line would be a suitable alternative.

Yes, FLASH RAM would be workable, but... you'd also need a boot ROM
with the read/write routines for the FLASH update in it. Otherwise,
one hiccup and your computer's OS could be toast with no way to fix
it. Just like blowing away a motherboard with the wrong BIOS
upgrade. And of course, add the cost of the boot ROM and
interfacing.

If I recall correctly, when Parx closed, Studio Son developement was
continued by authors (until early 2000) under the name V-Trax.
Early 2000 V-Trax developement was discontinued, but the program is
now freely downloadable. Not sure if the manual is available for
download.

Hi Janez,

>>More and more I get the impression that in this newsgroup liking
>>commercial software isn't appreciated...
>
>Well software which act like Microsoft is not indeed.. ASH clients works
>only with other ASH clients and they are all commercial...
ASH is a software publisher, so it's only logical that they sell software
isn't it? that's how the make their living. They haven't forced anyone of
the market by using maffia tactics like Microsoft and they certainly are not
interested in destroying the other Atari software publishers...
When IConnect was first released, STiNG wasn't even there yet, and STIK only
offered the SLIP protocol. So in terms of features and also the ease of use,
IConnect was like a fresh wind blowing...
Everyone who bought CAB got IConnect, Fiffi and a rudimentary telnet client
thrown in. All that needed to be bought was ASH Emailer, I can understand
you don't wanna pay for a mailer considering that this platform is flooded
by free mailers. But even today the only mailer that is comparable with the
commercial one is Okami, all the others offer less features and/ or are bug
ridden. So you pay for ease of use and features... do you remember the never
ending stream of Newsie users having problems? I haven't seen many postings
of people loosing their posts with ASH Emailer.

Why aren't there more IConnect clients? could it possibly have something to
do with the attitude of this community? Amail can run under IConnect, so
it's not like it can't be done....

>Not to mention that u must pay if u want to run stik/sting apps, which are
>most free.. So u buy OS, apps and if thats not enough, go any pay if u want
>to use 3rd party appy.. Worse as M$. U dont need to pay, if u want run FREE
>PC program..
Sorry Janez, but IMO this is bullshit.
If I feel the need to run STiK/STiNG clients I can do so. IConnect and STiNG
don't conflict, you can boot both at the same time and hold both in memory.
The only advantage of using IFusion to run STiNG/STiK clients might be that
the user doesn't have to bother setting up STiNG, which is not always easy
for some users. I can remember the endless stream of postings on that topic
also... But most importantly: It's *NOT* ASH who decides if something is
free or has to be payed for for. The choice is entirely up to the developer,
Jï¿½rgen Koneczny decided he wanted to be payed for his efforts, you may think
that these efforts aren't worth paying for, but that's not the issue here.

>MiNTnet for example offers FREE stik/sting and Draconis translators..
So what's your point? You should go and blame the MiNTnet developers for not bothering to program a FREE IConnect translator... what's stopping them? and who would possibly want to use the Draconis translator?

Cheers from Belgium

The main page for the Atari800 emulator is at http://joy.sophics.cz/a800
Among other things you'll find there a reference to the Atari800 ftp
archive where you should be able to find binaries for the Falcon.
If there's any problem you can contact me to get latest binaries.

>
>I don't have anything against commercial software, I have spent
>(and still spending) quite some money on commercial app *BUT* I
>dislike commercial soft which is still on sale although the vendor
>perfectly knows that the developement is stopped.
I "thought" that the development of Draconis was stopped, but was corrected here last week...
You may dislike paying for commercial software of which the development has stopped, but that's the way it is. The author still needs to be re-imbursed for his work even if he pulled the plug on the project. The legal copyright doesn't expire because the author(s) don't support their work anymore. The Beatles have stopped singing years ago, but you still have to pay up if you want to buy one of their CD's.

How can you possibly know when development has come to an end? will there ever be a new version of NVDI, Kobold, Papyrus, N.AES... etc?
Considering the state this platform is in we should thank our lucky stars whenever one of the applications is updated. I think your attitude is a dangerous one, in a different thread someone wants to know about the legal status of Thing, should we tell him that the development most probably has stopped and not to bother paying the shareware fee?

>I won't give one EUROcent on apps like MagiC, Chatter, ASH Emailer etc.
>The worst is that they even won't release the sources. People are begging
>for the release of Cab but no they just don't give a damn for their former
>clients.
These people need their head examined... why would someone give his work away ? especially to a community which never appreciated it in the first place. You conveniently forget once again that ASH is a software publisher, copyright of the software remains with the author...

>ROTFL: ASH mailer can't even quote properly.
I'm missing the point Martin.... are you suggesting that I quote the posts unproperly?

Cheers from Belgium
Dennis

Hi Janez,

>Not to mention that iwe seen with my own eyes, that ASH in CAB 2.x manuals
>says that only IConnect offers pppd, that not even MiNTnet have pppd and
>that Sting/Mintnet ovls are not free, which is clearly damn lie.. Yes u re
>right, i dont like such apps and attitude!
You are referring to the English manual, translated by Joe Connor and
published by System Solutions. You're absolutely right, they goofed...

<SNIP>
PPP-Connect is included with CAB 2.0 or later. This TCP/IP stack
supports both the PPP and SLIP protocols which makes it ideal for use
with most Internet Service Providers (ISPs).
Both STiK and MintNet only support the SLIP protocol. At the time of
writing, the CAB.OVL files for MintNet and STiK are both shareware
programs. They are not supplied with CAB but are freely available from
online services and public domain libraries.
<SNAP>

It's not an attitude but human error... Joe slipped up while translating
the German manual... let me assure you that in the original docs there's
nothing like this. It's an unfortunate error, but don't go blaming ASH for
this, they have nothing to do with it.
Instead of "shareware" it should have been "freeware". But STIK did not
support PAP in those days, and STiNG wasn't even released yet. So at least
that bit is correct. Are you sure that pppd was already fully supported
in the *official* MiNTNet release back in late 1995/early 1996?

Cheers from Belgium

Hi all,

As though following this discussion at a computer newsgroup I would like to follow the idea of some others:

What might be the purpose of this $300 machine?
What kind of task does it need to be prepared for?
By what features might it be sold? (What is the difference to existing systems ranging from gaming consoles to standard PC?)

While scanning through all the answers I picked out one topic pointed out several times:
it has to be userfriendly - that thing must be some sort of plug-it-in-and-there-you-go...

I consider that it should be some kind of entertainement-station looking like the typical audio-hifi-stuff. There has to be the possibility to run all kind of media: from CD, DVD, to internet-based-information (including connectivity for VCR, TV, ...).

Concerning the OS I am not sure if something capable of what I am thinking already exist: the GUI must be designed the way that even the unexperienced generation of my parents (~ 60 years) will be able to use it from the beginning: Putting in some media must make the thing behave like the very same machine they are used to. A DVD-movie must change the display to some kind of "VCR"-display with touchscreen-buttons and moveable-regs ...
Or feeding it with a electronic lexicon must change the display ... to some e-book like view, where it is straightforward to turn around "pages" or flipping over to the relevant part of the book.

Saying it short: fit it to the typical living room equipment, close to the TV. Prepare for all kinds of computer periphals and home equipment (coffee-maker, fridge ...). Integrate phone, fax, mail, sms.

To be discussed,
Helge

The address space of the 286 was 24 bit, although those 16 MB of
memory was addressable only in protected mode -- in real mode, the
286 could address 1 MB + 64 KB.

Hello.

I've gone all misty eyed and want my PC to look just like my old Atari STE - anybody any idea where I could get hold of a desktop theme?

I've tried Google without any luck, and the Little Green Desktop site has vanished. Damn.

Thanks in advance.

I'm not sure where to get an upgrade from, but if you wish to speed the
modem port upto 38400 bps then thats a simple circuit using a 74LS74 chip.
My STe has this fixed in.

Hi!

I have some JPEGs that a friend wants to use on his web page.
Unfortunately the scanner was set far too dark (no, he can't re-scan).
Is there any Atari ap that would allow me to lighten them and save
them as JPEGs again? I have tried some of my image processing programs
but most won't handle JPEGs (other than load them). I finally tried
Calamus, which loaded and processed them, but couldn't save as JPEG -
only TIFF and BMP. I saved as TIFF and then used Imagecopy to convert
to 256-colour GIFs, but what started out as a 25 kB JPEG finished up
nearly half a meg of GIF! Don't think anyone wants to download that!
Any ideas how this could be done? I tried converting the GIF back to
JPEG in the new Pixart, but the computer crashed each time - with or
without MagiC and Thing.

Regards, /Peter/

Are you talking about hardware or software here?

> A lot of you have got a PC or a Mac somewhere in your house. Obviously, you've
> bought that instead of the Milan. That doesn't sound like much of a
> commitment.

Excuse me, but I have an iMac as well as my Nemesized, recased, CD-RW'ed, etc Falcon. I don't have the iMac because I don't love Atari. I have it because I've run into a brick wall with the Falcon created by a lack of software. Give me a good web browser for the Atari, and I'll use my Falcon for everything. I like it much better than the Mac anyway. But until then, I'm forced to deal with using the computer with the better software. I'm pretty sure the same is true for most people. I don't think many people here would sing the praises of Windows and MacOS, but modern expectations of machines make owning these a requirement. So please don't accuse me and others of not being committed to the Atari platform.

> You expect your 1993 hardware to keep running whilst happily
> throwing dozens or hundreds of megs of RAM and equal amounts of MHz on Windows
> or Mac systems. By doing so, you're reducing your Atari to a mere toy, whilst
> moving more and more of your computing tasks onto the alien platform.

Like I said, show me Atari software that outdoes what software on my Mac can do, and I'll never invest another cent into the Mac. I've also invested money into my Falcon. But at this point, there's not much more I can get for it. I'm not really interested in the clones, not because I'm not committed, but because of what I use the computer for. My Falcon is my dedicated music computer, my word processing tool (Papyrus kicks AppleWorks' butt), and yes, a fun toy when it comes to games. My Mac is basically for Internet work that my Falcon can't do, and for running other software not available for Atari machines. When an Atari clone can do any of these better than my Falcon and Mac combo, then let me know. Otherwise, don't bash those of us who own other machines out of necessity.

> Besides, I don't buy that argument about Clones being expensive. The Milan
> mobo costs around 500 EUR, IIRC. It's not very hot compared to that iMac over
> there, but it's a bloody fast Atari system, and that should be enough of a
> selling argument.

Sure, if better software existed. That's the problem. There's no modern software, and I've got no reason to spend money to word process faster. Make a Cubase Audio clone run on one of these, a modern web browser, etc. run on a Milan or Hades, and I'll be first in line to buy one... Oh, yeah, where can I get one in the United States? Ever hear the story of a friend of mine who ordered a Hades, and when he got it, it had some hardware problems, and when he had to send it back to europe, it got lost somewhere between the US and Europe, and took years to get it back? I don't like doing over-seas transactions, personally, and I especially don't want to risk such a huge chunk of cash on the over-seas exchange system.

helgetu (h.schaefer@tu-bs.de) wrote:
: What might be the purpose of this $300 machine?

It was originally targeted for computer hobbiests. Given the groups we are posting to, it would share some of the characteristics of the 8 and 16 bit machines of the 80's, or would suit the tastes of the current users of these machines.

I was thinking of something easy enough for an amateur to understand the electronics, and low level programmaming of the device. (My view is that modern machines are too complex and too poorly documented to fit this market.)

: By what features might it be sold? (What is the difference to existing systems
: ranging from gaming consoles to standard PC?)

Any computer would have to be differentiated from current PCs, game consoles, and PDAs in a *significant* way. It would be next to impossible to compete in the present computer/entertaiment industry with a product which the big guys view as viable.

: it has to be userfriendly - that thing must be some sort of
: plug-it-in-and-there-you-go...

User friendly is a very vague notion, because what is obvious for one user, will appear to be counter intuitive to another. Particularly so if you are attempting to differentiate yourself from current products. Also, there are different levels of user friendliness: easy to learn, vs. easy to use; also, I view current systems as being difficult to program (too much so if you are not a professional programmer). Older systems were much better in this respect. As an example: it was easier to put graphics on the screen in the olden days. With the Apple II you simply switched to the appropriate video mode, then drew lines or pixels. There was no windowing system, or complex event manager, to mess with. On modern systems, you need to obtain special tools (such as ghostscript) to create programs incorporating graphics -- in any reasonable manner.

: Concerning the OS I am not sure if something capable of what I am thinking
: already exist: the GUI must be designed the way that even the unexperienced
: generation of my parents (~ 60 years) will be able to use it from the
: beginning:

A nobel idea. It is not the suggested market, but you certainly have ideas worth exploring.

: Saying it short: fit it to the typical living room equipment, close to the TV.
: Prepare for all kinds of computer periphals and home equipment (coffee-maker,
: fridge ...). Integrate phone, fax, mail, sms.

Integrating too much stuff in one device can complicate the life of users.
So, while a fax/mail/phone device may simplify communications, and a DVD/CD
device may simplify entertainment (particularly given the physical similarity
of the media), a DVD/CD/fax/mail/phone device is going to present too many
dissimilar options to the user. IMHO, that is one of the reasons modern
computers are not very easy to use. Better to use the old stuff, where the
computers did computerish things (interactive entertainment, or content
creation).

Byron.

AFAIK, Thing is still maintained. Only it takes very long before
the author release a newer version. I've seem the latest
version and I must say it looks very nice.
Besides Thing is Shareware and can be used (with restrictions)
without paying the fee.

>away ? especially to a community which never appreciated it in the first
>place. You conveniently forget once again that ASH is a software publisher,
>copyright of the software remains with the author...

My believe is that ASH forbid the authors to release their soft.
It's the fault of ASH that the community doesn't appreciate the
way they work. They have done everything to force people to buy
their products.
Even nowadays there are still some programmmers who force people
to use that dreadfull w_dialog. Take for instance 'attribute'.
Why one earth do we need w_dialog for such a basic application?
>
>>ROTFL: ASH mailer can't even quote properly.

>I'm missing the point Martin.... are you suggesting that I quote the posts

Fixes or no fixes, I'm pretty sure that your problem is due to either a fragmented harddisk or that the CPU-clock needs a fix (or another than the one that's been made...). I've fixed several Falcons which had been CPU-clock fixed, by making another of the three available clock fixes. Check out my website for all the info you need on this topic. Go to the Troubleshooting page.
I've heard of problems when running CAF with the Nemesis installed, so maybe you should try disabling it.

> Is there _any other_ multitrack/digital recording software for the
> Falcon that does at least 8 tracks, can utilize the FDI for recording,
> and doesn't suffer from these BUGS in Cubase Audio? (an additional
> plus would be the ability to also playback MIDI in sync with the
> recorded audio tracks).

AudioTracker from SoundPool is nice if you want to work only with audio - but it has no midi sequencer. It can make use of the S/Pdif, ADAT interface and the JAM/FAD units with up to 8 simultaneous inputs from Line Audio Design (www.lineaudio.se). The JAM/FAD have been discontinued, just like all SoundPool's hardware units for the Falcon, but there might be used ones around... Go to www.soundpool.de and download the demo version.

> VST or Pro Tools)
>
> Any suggestions? I'd like to keep using the Falcon.

I continued using my Falcon for a very long time after they started claiming that VST on the PC really did work well. About 2 years ago, I took the platform leap and I must say that I've never had such a beautifully running system. Over 50 audio tracks with sample-correct sync (The Falcon can't even give you sample accurate audio sync with the 8 tracks it handles - but it's still good enough for most people...) - and perfect sync to midi thru the Midex8 USB-interface. Nothing fails even though I use the PC for everything from office programs and games to Internet and music :) If you're going for a PC setup, feel free to check out my machine on my website - the studio page. Also check out Dan Duskin's site for a lot of useful info.
Don't get me wrong. I'm still an Atari fan and I attended the NAS (Nordic Atari Show) this year as a retailer, showing off a Falcon based studio - but I also live in the real world and realize that there are better solutions around - especially since the hardware units aren't manufactured anymore :(Any questions? Please feel free to ask.

That's easily enough done on this Risc PC, should I need to do so. However, it's better to let it run its boot sequence so that disk-based resources can be located and initialised.

> Unfortunately though, if there were any bugs in the code, (HA.. IF) you
> were stuck with them until the manufacturer could get around to first
> finding them, then fixing them, then finally producing a new version, then
> distributing them, then finally you get to open your machine and manually
> replace them.

Or you might be able to load patches or replacement modules or even a whole ROM image. Two of those apply to this machine, and yes, there was a short while before I got hold of RISC OS 4 ROMs when I was softloading a version of the OS...

[snip]
> (Of course, it DID generate a nice little "cottage industry" for
> programmers to come up with fixes and patches while waiting for the
> "official" ROMS to finally appear.)

That happens in the RISC OS market to a small extent. Of course, it helps when the OS supplier can and does release patch archives (or "service packs").

> Do you really want "Mom and Pop" $300 computer buyers to have to be prying
> ROMs out of sockets and jamming new ones in?

Probably not... flash ROM is finding its way into new machines and onto some hardware upgrades; there is a StrongARM processor card which has this.

> Actually what I always thought Atari should have done with the ST was to
> put the OS on a cartridge.

Maybe...

> That way they could issue updates which could be swapped as easily as
> changing a game, and the old cartridges could be returned in the same

> shipping box for a credit. Sort of like deposit soda bottles.

Or you could keep it and sell it on to somebody who hasn't upgraded to *that*
version, never mind the current one. Although that's almost as easy with just
the chips themselves :-)

[snip]
> FLASH RAM would be workable, but...

Flash ROM, surely.

> you'd also need a boot ROM with the read/write routines for the FLASH
> update in it.

True...

> Otherwise, one hiccup and your computer's OS could be toast with no way to
> fix it. Just like blowing away a motherboard with the wrong BIOS upgrade.
> And of course, add the cost of the boot ROM and interfacing.

Not to mention if you have your mass storage on a third-party interface card
which has its own on-board firmware, which the OS will softload or access
directly and which is probably itself in flash ROM... although in this case,
a floppy with the firmware and, optionally, a flash programmer for that card
would do.

ImageCopy v4 can load the Jpegs, automaticly add more light and save back
as Jpeg again. Same with several other programs, GemView for example.

Whats stoping them? Bloddy "Magic required" message from most apps
stopping them.

Well this really pop out the cork, as we say.. U are champion of
twisting words.. WHY i would blame MiNT-net programers? I only said that
MiNT-net as tcp/ip stack also offers Stik/Draconis translator, Iconect is
possible as well and thus its most complete stack! And who want to use
Draconis translator? U realy do this crap intentionaly do u? I would for
example, if Adamas will reach usable stage, ill use it on my system, with
ethernet (mintnet) and things i already use on my system. Reading your
views i did notice all from ASH is ideal, and all other is crap.. Why
someone would use anything other (those are yours words) U decline either
other stack apps, other apps or even possibility of multiple stack
system.. U keep bashing me about not want to pay for apps, i have news
for u, it may be that i have more commercial apps than you, i DO buy them.

Plz dont bother to reply, u wont change views anyway, use your apps,
enjoy them and bash all other for fact that ASH dont develop them anymore
etc as u do.. Yes community is to blame... and there is lotsa of us, using
MiNT not Magic so u have lotsa ppl to blame for all.. ASH surely cant be
quilty a bit.. Only last word, i have 5 friends which are now Mac
users.. All went excited way back with MagicMAC, get Mac's.. well fun
lasted some time, now all xcept one are real Mac users.. Do blame
community again.. do not bother to reply.

Janez

P.S scroll back and u will soo how all that start.. Mentioning Unix
CRAP, Magic/ASH apps far superior bla bla, some thoughts about
community i kepp blame.. i dont wana be part... And before u label me
ASH/Magic hater, list all messages and seek for words *crap, bad, shitty*

```
and so on...

There is software, Photoline for example. Also u may use standalone
tga/jpg converters such as Apex module (cpx, nice and offer batch job), or
djeg/cjpeg tools etc, and use your fav Image processing stuff.. Otherwise
Photoline is preety cool, u can do it in Apex as well..

Source record: 43452

Hello all

I am an ex-atari user who kept his 4meg STE in the loft for the past 3 years or so. I fished it out yesterday, got the HD connected again and am now enjoying a trip down memory lane!

I've got a PC running windows ME, and am wondering if there is anyway to share data between them in a more modern way than by using floppies. I not only would like to share files, but also a net connection (?)

IS any of this possible? I seem to remember a prg which enabled to (or more?) STs or Falcons to be networked by using the midi ports. Maybe this would be some kind of solution?

Any help would be greatly appreciated, even if its to tell me it can't be done!

i look forward to any replies....

Leo Z

Oops, yes! I should've said that this works with MagxDesk and
HDDriver...

While this does work for me, I should also mention that I've never
been able to unpark the drive, so it gives me a system hang every time
I accidentally use the combo (I'm mis-keying Ctrl-Alt-J) to open the J
drive...)

> Why one earth do we need w_dialog for such a basic application?

I can totally understand what you're saying here Martin and the
frustration caused but.......
and without dreaming to speak for any authors, from most of the
conversations I've had over the years with programmers is that they
more often than not have programmed the software because it was
something _They_ actually required or to replace some other software
that they weren't happy with. So perhaps if an author actually always
uses MagiC or MiNT for example it's safe to say that they would be
more likely to use the available features within their chosen OS or
the environment they're used to working in.

Just a thought.

PhotoTip version 3 does this just fine under Magic/Geneva/N.AES. Just
load in a JPEG and you can lighten or darken it to your pleasure. Then
you can save it out in a TIFF or JPEG form. You can download it at the
site below, but you need to register it to get it's full potential.

I think HiRes fonts were available in Lo-res IIRC (though I don't
think CAB runs in low res, does it?)

> His GDOS and fonts came from an ST Club disk with STDCAT on.

Many a corrupt font from PD IME.

> The 'differing appearance' I mentioned affected just the first para
> after the header in high rez, though it had the same font size tags
> as all other paras, which were OK.

I was thinking it might be a different font to the rest of the body
text.

Sorry if this wasn't an appropriate answer...

Hi Peter,
Doesn't LookNSee do this? There's a brightener module with various
settings as well as JPEG import and export (as you must already know).

Alternatives are Positive Image and Imagecopy of course. With IC bear
in mind that if you change the brightness in Options\Screens\Colours
before loading the JPG when you resave as JPG you will be losing
further colours from the screen depth that you are in, so I'd advise
running in maximum colour depth before you try it.

I just had a quick go in IC4 and the X-convert option didn't seem to
account for the brightness for me.

Hi everyone!

I'm looking for a way to connect Atari 520 ST to ethernet-based LAN. I know absolutely nothing about network stuff for Atari, so all help is warmly welcome!

Thanks! =)

- Jari

How about Transmeta's Crusoe? This would outsell everything mentioned thus far I guarantee it. It can emulate anything, including x86 at native speed!

Can you imagine UAE ported to Crusoe as its code-morphing layer? incredible.

Modules could be made for just about ANY old school CPU/platform, and an OS wouldn't need to be developed for it, as it could run these platforms OS's natively, maybe even in addition to a custom OS.

Marketing would be a piece of cake, as you could use it from anything from a Kiosk to a webserver, an Amiga emulator to a Unix portable. Webpad's, PDA replacements, hardware controllers, you name it, this thing would be /versatile/!

And the best part is it's /current technology/. Face it, if it can't run Half-Life or get 200fps in Quake, your only buyers will be the people currently reading this thread. :)

Linux Geeks would love it! (if only because Linus works for transmeta). Slashdot would pimp the hell out of it, you wouldn't even need to market it :)

Hell, I'd buy one and just run it as my mail/webserver and
router/firewall. transmeta already has a custom linux distribution
available for it. Not only that, but it could be offered in several
packages, you want WinXP on it? No problem!

The market could even be expanded to commercial vendors, it would be a
viable replacement for say, the hardware TiVo uses now. Cable
descramblers, Sattelite receivers, hell, I can think of very little
you couldn't make this thing do.

R&D required? very little, the hardware is ALL standard, and already
made, produced, and sold, not to mention it already has HUGE "geek
mindshare."

1993. Finally, 14meg Falcon RAM card works!

Newsgroup: comp.sys.atari.st
Date: 2001-07-19 04:16:46 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3b566041$0$18888$272ea4a1@news.execpc.com>
Source record: 43464

Hello,

A Long while back I purchased a RAM card and SIMM module. (New)
One of the connectors on the RAM card got damaged when I
installed it. Probably by an irregualr pin on the motherboard
of my computer. Not sure.
I researched and found a connector (PCB header) that would fit.
One that would allow space for the irregular pin on my motherboard.
Got it back together, Computer would run for 30 minutes then freeze with
vertical dashes on my screen.

I had the SIMM module checked by a technician who had a RAM tester.
Nothing wrong with it.
I could not see anything physically wrong with the RAM card.

After getting some input from the newsgroup, I decided to try
another SIMM module.
I found a 16meg stick with less chips on it.
Put it back together and used electrical tape around the PCB header,
just in case any shielding might be showing.

Booted and works fine! No crashes after 30 minutes!

Thank you for your suggestions.
This has been one of the most difficult problems to solve.
Especially finding a PCB header to match.

I checked RAM through Flash II (Memory) and EXTENDOS.
Everything checks out. But FREERAM.PRG does not seem
to be giving me an accurate byte count.
Is there a limit on this program?

thanks

ken

I dont think thats true. The transmeta chip only deliver a fraction of the performance of a core like the thunderbird at the same mhz.
And you can go in a shop and buy a single chip for under 90$ (the 1.2 gigahertz part).
But then you can get a 750mhz similare core (Duron) for 25$... thats your price.
I dont see the point in using a much slower chip like the transmeta crusoe for a desktop/booksize PC.

just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver 46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

Their is already so many core running on the x86... From the most obscure to
C64 & amigas.

X86 would be a better choice at all level... Unless this is for a PDA form factor.

>

Computer do alot nowdays in term of multimedia because of the power they have.
I'm not so sure intel/amd etc.. just develope for people to run half life at 500FPS.

Why would you want to pay for low performance?
Run x x86 version of the major OS... run Ti calculator or c64 class stuff under emulation.

>

You would need native code to do software encoding on that chipat a decent speed.
Who would write all that code?

>
> R&D required? very little, the hardware is ALL standard, and already

This is not correct. You can also use Linux. You cannot claim Linux not
to be modern. The company I work for uses Linux as the primary
development platform and at home I am also running Linux.

That has no influence on legal matters. You may only copy softwae if the
author gave the permission to do this. In any other case your copy is
illegal. This cannot really be a point of discussion because the laws
are more than clear.

>
> My believe is that ASH forbid the authors to release their soft.

I know many ASH employees and the authors of software distributed by ASH
in person. ASH has never forced them to to anything. I don't understand
what you are claiming here. You don't seem to know the facts at all.

> way they work. They have done everything to force people to buy
> their products.

Sure. They should have quit the Atari market long time ago, if that's
what you want. But then there would never have been a MagiC 6.2 update,
for example.

> Even nowadays there are still some programmmers who force people
> to use that dreadfull w_dialog. Take for instance 'attribute'.
> Why one earth do we need w_dialog for such a basic application?

Ask the programmers. This is not the fault of those distributing
software.

> It's ofcourse not the fault of your beloved mailer but of you.
> Your postings are rather difficult to read. You should leave one
> blank line between the original and your answer.

If this is your greatest problem you must be a very lucky man.

That's interesting- the MMU in my Atari ST (68000) was one of the
fairly easy "hack" points where you could physically attach memory
expansion cards, since all the address lines were available.

I don't know if Atari used an "off the shelf" Motorola part though.

The reason the ST was limited to 4Mb of RAM was that the MMU only had
enough address lines for a max of 4Mb.

(Atari folks loved to poke fun at PC folks and their "640K" limit-
right up until they tried to put more than 4Mb in their STs. Same
situation- the company "knows best".)

I don't have all of the other postings available right now, so I have to ask whether this is an IDE or SCSI drive? Which model? If this is an IDE drive there might be something wrong with the drive's power management.

There is nothing like a Atari formatted drive. The format of all drives
is the same. The difference is the filesystem layout, which is created
when partitioning a drive.
Windows cannot use TOS compatible partitions, but Linux can. You can,
however, either use PC compatible partitions with MiNT or MagiC or with
HDDRIVER create a single partition on a drive that is both Atari and PC
compatible. In the latter case you do not need any additional software,
except HDDRIVER of course.

Software that is based on the SCSI driver (the complete HDDRIVER 8
package including the auto spin down software is based on it) will work
on any machine where an SCSI driver is installed. For MagiCMac you
should ask Steffen Engel for a current version of his SCSI driver for
MagiCMac. With this driver you can park any device under MagiCMac that
is supported by the SCSI driver.

At last! There are many differnet types of simms, EDO, FPM,
parity, non parity etc. Seems bad how the company supplied the wrong
type of simm though. Not very good.

>or you could run gemulator explorer on the PC

Yep! if you got the FULL version, which comes with gemulator!

The one that's free to everyone only does ONE file at a time:((((

I did drop a line to the powers that be ages ago, as i was prepared to
pay for that program on it's own, but never heard anyting back!

I use HD Driver, with MO optical disks and have had no problems at all.
I;ve also used it with EZ drives (ez135 meg carts), and i think
panansonics PD drive.

If you have a SCSI card in your pc, then i think that would be the best
and easiest method.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1255744226

This is a mint 1040 STE that I upgraded to 4MB. I also upgraded to label to indicate the new RAM size. This "4160 STE" custom label is a genuine collectors-item factory product from Atari.

This machine looks and operates like new. Just tested and took these pictures on July 14, 2001. I have owned it for several years, stored in my office and for the majority of the time it was left under its dust cover and not used. It will be a handsome addition to anyone's 16-bit Atari ST collection and should give many more years of service.

This 4160 will be wrapped in plastic, encased in styrofoam and shipped in an original Atari snug-fitting 1040 ST box with assorted accessories including mouse, power cord, and a few books.

Please follow the link above to see pictures.

2011. FA: MIB Megafile 30

This is an excellent hard drive for the Atari ST line computers (ST, STE, Mega, TT). It has been fully tested (on 7-14-2001) and works and looks like new. The head has parked for shipping, and the unit will be shipped in its original box and blue molded packing foam from Atari. The drive is loaded with desktop publishing and word processing software, along with SLM-804 Atari Laser Printer drivers and fonts.

The drive in its origianal box comes with a power cable and a disk entitled "Atari Hard Disk Utilities".

I think he wants to make clear that most emulator users doesn't support the Atari scene at all. This is my believe also. In the long term emulators means the end of the original Atari scene. I know a few former Atarians who have a Mac now. In the beginning they were very enthousiastic about MagiCMac. Nowadays they hardly use MagicMac lets stand that they buy new Atari apps. The only reason why they still use MagiCMac is because in the past they have spent quite some money on Calamus and because the MaC opponent of Calamus is too expensive.

>warmly welcome!

This can be made in two different ways:

Get an Ethernet adapter/card for your Atari. This is at the moment not an easy task. Some are sold out and others are not finished yet :-(

Let one of the other computers act as a router and connect your Atari via the COM port. This is a bit more complicated but can be done. I have some instructions (slightly outdated by now) on this subject on my home page. Url in signature.

>P.S. When replying, please send a CC to my e-mail address

You might want to add the header line:

Mail-Copies-To: jhuovila@iobox.fi

This will make any descent newsreader do this automatically.

>more?) STs or Falcons to be networked by using the midi ports. Maybe this
>would be some kind of solution?

No, install STinG tcp/ip get a nullmodem cable and setup the pc to route
via COM port and off you go with a ftp server on the Atari running at
19200bps. Slow but fun, and works with single TOS too.

(But off course an Atari is fully capable of running tcp/ip over MIDI
cables as well. I have never heard of a PC capable to achieve this little
trick, though)

This is actually a bit complicated but can be done!

Some info on the subject can be found on my home page below.

You could use MagicPC to share a net connection, effectively transferring
the Atari to the PC, file sharing is as simple as plugging your SCSI chain
into a SCSI card on the pc so your PC will see the Atari drives.

But, in fact you actually had to by TOS itself to be able to run any
other software. So by now you should be quite used to that :-)

I see no harm whatsoever in this as long as it is clearly stated before
you buy the program. And, NVDI really is an OS extension and as such
comparable to TOS itself!

Sounds odd that that is the problem, maybe the TOS version is causing an
odd effect like that. Anyway, you can slow the Falcon down with some
CPXs.

Attribute is a small utility to change the file flags. So why does it
needs W_dialog?
I can understand that programmers uses w_dialog for certain programs but
I can't understand why they force people to use it. Attribute refuses to
start up without w_dialog. Why?

Buying TOS?

>I see no harm whatsoever in this as long as it is clearly stated before
>you buy the program. And, NVDI really is an OS extension and as such
>comparable to TOS itself!

Right, but Papillon 3.x requires NVDI 5. It will not run with NVDI 3.
It's stated on the homepage of ASH.
Lots of people are still using an older version of NVDI. If they wish to
use Papillon they'll have to buy NVDI 5 also. This methode reminds me to
the methodes Bill uses.

Yes that was my point.. I respect ppl who said "well its enough, im
moving to PC/MAC" and migrate.. so i dont feel bad since ppl move.. But
Magic Mac was reason that lotsa ppl move to Mac (or PC) and most of them
aint Atari users anymore.. ASH is happy, 1st user buys Magic Atari and
later Magic XXX, great business move, i must admit.. Since i know few such
persons i dont talk rubbish... And all are happy, looser is Atari scene

Nothing wrong with it.. Problem is: they all are Atari apps, so they
should run on all or most OS-es.. Thats particulary hard to achieve with
TCP/IP stacks, so maybe they can be excused, still other apps with no
special needs should try to be more flexible.

Well, if it's that easy, perhaps you could suggest that to the programmer.
I see no reason why he/she should refuse to alter this.

You can already do all of this with CoNnect. It is a while since I used
it, so I cannot remember the details, but it has the capability to run a
shell in a CoNnect window, and then you can run telnet, ssh or whatever
programs you like.

Ahhhh, so that's why with DR-DOS 6.0 or MS-DOS 6.0 you could load DOS high!!
I didn't know about the extra 64K (rather, I didn't know how you could use 64K of the remaining 15 megs of protected mode.)

Thanks Janez!

Don't have Photoline, do have Apex - but I haven't tried the CPXs
(I have two, V1 and V2 - I think the first is for 68000 and V2
for 68030 as well?). Can't find my manual at present, and don't
think I have djeg/cjpeg tools, only the apex viewers. I find these
very good as they will show TruColor or 256-colour images with the
screen at any resolution - even monochrome! But of course they
won't convert.

How do you do that? The only brightness etc. sliders I can find
are for the screen and another for printing. Are you saying there
is a way to use them for copying as well? I can't find that in
the manual. Or would this need another screen grab? Difficult as
I am running in 32k colours max at present on my RGB monitor.

Hi Harry!

I thought the Brightener module only affected the screen display
and didn't affect exported images - at least there is nothing
about it in the HYP.

>Alternatives are Positive Image and Imagecopy of course. With IC bear
>in mind that if you change the brightness in Options\Screens\Colours
>before loading the JPG when you resave as JPG you will be losing
>further colours from the screen depth that you are in, so I'd advise
>running in maximum colour depth before you try it.

Haven't played with Positive Image yet, though I have V2. With
Imagecopy, as I said elsewhere, do the Options\Screen\Colours
affect saving as well? I thought it was just the screen, and
having just tried it for Convert, the sliders seem to have no
effect. Or do you mean I should make a new screen grab with the
lightened image? In that case I only have 32k colours available on
my RGB monitor, but that should do in this case.

There are two program that will do this. One is Ghostlink which needs a
null modem cable. The is PARCP (I use this) which needs a special cable
connected to the printer ports of each computer.

I have to speak out here. No one is forcing to buy or use Papillion 3. If you don't like it, don't buy it (and don't steal it). I'm sure there are other programs that can do what Papillion does without NVDI.

As stated before, Papillion needs a GDOS/NVDI type graphics OS extension but this feature was never built into TOS. They make the requirement because it NEEDS the features of NVDI 5. What's wrong with that? A program pushing the hardware to its limits via software.

NVDI is still a damn good piece of software. And you can actually buy it.

TOS is not a "modern" OS with tons of doohickeys like a graphics font system, screen saver, etc. built in. If you don't like having to buy NVDI, Magic, Geneva or other OS extensions, why don't you buy/use an OS that has these features built in since it's bugging you so much? Bill isn't forcing you to buy a separate graphics font system - it's built in already.

Phil
(who's tired of some people who call themselves Atari users wanting everything Atari for free...)

2048. FA: Atari SC1224 Color Monitor - 1 day left (currently at $10)

FA: Atari SC1224 Color Monitor - NO RESERVE

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1255615214

This is an original factory Atari color monitor, manufactured by
Goldstar for Atari .

(the faded spot in the middle of the screen is due to my digital
camera's inability to match the screen's sync)

It has a built in speaker, volume control, brightness control, and
contrast control. It's in perfect shape and the screen has no
discoloration at all:

The monitor has a standard 3-prong power connector and the power cable
is included. The cable to connect to the computer is built-in and is
in good condition (no bent pins).

FA: Atari STacy Laptop 4mb RAM 130mb HD, MIDI Software pre-installed

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1255558306

A classic Atari computer: has been upgraded to 4mb of RAM and has a 130mb internal SCSI hard drive. Keyboard mylar was recently replaced with OEM part from Best Electronics.

Amazing tool for MIDI production! Scroll down to take a look at all the midi software that comes with this stacy. This STacy has *NEVER* crashed in the 6 years that I've owned it, and the MIDI timing is proven to be more solid than 99.9% of PC's. This is thanks to the custom built in midi hardware:

Case has a few scratches and a couple of chips but everything works perfectly. Cosmetically 6.5/10, 100% functional.

The screen still lights up (as you can see from the pictures). It's missing a couple of plastic covers but this doesn't affect operation.

BONUS!! Power supply has been mounted internally so that you don't need to lug around an external adapter. This STacy now takes regular PC power cord which is included here.

(I really don't want to part with it but alas, I'm saving up to buy some new studio equipment)

Software Included:

Midi Sequencers

-Dr. T's KCS Omega Sequencer 4.0
-Master Tracks Pro 3.6
-Cubase 3.1 (Doesn't need a dongle)
-Hybrid Arts Edit Track Platinum 7.1
-Intelligent Music "M" Interactive Composing System
-Electronic Cow Midi Arpeggiator

Algorithmic Composers

-Electronic Cow Charming Chaos
-Intelligent Music Realtime Algorithmic Sequencing
-The Groove Analogue Sequencer Simulator
-KCS Tiger Cub

Synths and Sample Players/Processors

-Electronic Cow Scribble Additive Synth

You don't have to buy such software. But if you do you pay for the
software in its current state. Of course it is desirable that there will
be updates and support for this software in the future. But for updates
you have to pay separately anyway.

> and others to convince me of the opposite.

Just talk the those who have been writing software that was/is
distributed by Atari. All of these programmers have e-mail addresses.
Note that HDDRIVER is also distributed by ASH. But I also sell it and a
few other dealers like Atari Workship also do. Nobody forced me to do
anything. It was my free decision to enable customers of ASH, that
otherwise probably would not even know my software, to also buy from
ASH. DISKUS, my hard disk tool, was initially exclusively sold by the
firm CCD, until they quit the market. I would not have had the time to
organise distributing software, that's why I asked CCD to do this.
Again, I was not forced into this decision. Finally, my OUTSIDE software
was distributed by Maxon computer, unless they quit the Atari market.
The reasons were the same: Not enough time and experience to do this on
my own. You cannot expect private persons, who do programming for the
Atari as a hobby, to study (most programmers were students) and at the
same time lead a company. Nowadays this is different and that's why I
sell DISKUS and HDDRIVER on my own now: There are not very much interest
in full versions and updates left, so doing this is much less time
consuming. And there are hardly any (reliable) companies left that you
can ask for selling Atari software.

> I don't like to buy or use an app in order to use another app. For
> instance Papillon 3.x. To use it you must have NVDI 5. The same goes for
> lots of other apps.

Without NVDI 5 there would probably no Papillon 3.x at all. NVDI
provides system calls that would have to be written by the authors of
Papillon themselves, which would have taken a lot of time, which they
did not have or were not willing to spend considering that the number of
Atari user was shrinking anyway. It's a waste of time if lots of
programmers write the same functions instead of using a software package
like NVDI the includes all these functions.

>
> I wasn't saying it is the fault of ASH. It very sortsighted of the
> Magic programmers involved.

In most of your posting you were blaming ASH. What you say now is
different from what you said before. And, as indicated above, there are
good reasons why some software requires certain other software
installed. I don't think you are a programmer, aren't you?

> >> It's ofcourse not the fault of your beloved mailer but of you.

> >> blank line between the original and your answer.
> >
> >If this is your greatest problem you must be a very lucky man.

What I meant was that this problem is really a minor problem compared
with other problems a human can have.

I know a lot. Just have a look at the SpareMiNT webpages. Almost any
program requires MiNT, does not run on TOS at all and only some run with
MagiC.

I know what he means. But if these users find the Mac to be a better
platform or just another platform that also fits their needs, what's
wrong about that? Everybody is free to chose the platform he wants.

So you would have been willing to pay considerably more for Papillon 3.x
because the authors would have had to spend a lot of time for writing
code that is already included in NVDI 5? I don't believe that. And you
would have probably complained that Papillon 3.x consumes too much
memory, which would have been the case, of course, if additional code
was required.
Maybe when writing all this additional code, knowing that this work is
useless because everything they needed would have already been present
in NVDI 5, they would have cancelled the whole project.

Sure, but the users that are now using a Mac are happy, as you already
said. This is bad for the Atari scene, but happy users is the really
important thing, isn't it? It's the human that counts, not the platform.
Computers are just machines.

You might very well be right with regard to the clock fix. But it's
definitely not hard disk fragmentation, as now that my Falcon is used
exclusively in my studio, most of the hard disk partitions are simply
empty, and used "fresh" for each recording session - and previous work
is archived to CD-R when finished.

>I've heard of problems when running CAF with the Nemesis installed, so maybe
>you should try disabling it.

Enabled or disabled, same results of random noises in recorded tracks.
And I did have this problem before the Nemesis was installed, though
possibly not to the same degree (it's hard to remember for sure).

>AudioTracker from SoundPool is nice if you want to work only with audio -
>but it has no midi sequencer.

I don't think Audio Tracker would work for me, but thanks for the
suggestion.

>I continued using my Falcon for a very long time after they started claiming
>that VST on the PC really did work well. About 2 years ago, I took the

>system.

Well, I did make the switch to the PC platform for pretty much
everything _but_ music/MIDI almost 2 years ago, but the Falcon is
currently the only computer in my studio. Although even if I do try
another program, or get CAF working better, I think I'm still moving
in the direction of building myself another PC just for music/MIDI in
the near future.

Thanks for all the help, and I'll visit your site again (I've been
there a few times in the past).

I guess using shared libs would avoid this common trouble of always rewritting code or depending on another commercial software... Both Mint and Magic supports SLB, and TOS does support it aswell with recent versions of Metados.

Rï¿½dacteur 4 is exactly the same WP than Rï¿½d 3 but with spreadsheet,
database and the rest integrated. I'm pretty sure the latest version of
Rï¿½dacteur 3 was 3.16.
Maybe your problem is that your copy is just for the ST and TT ? Did
you try it in ST High ? Rï¿½dacteur 3.15 works fine on my TT, but only in ST
High resolution. There was a VGA release of the program for the Falcon
(and possibly other machines too), maybe this is what you need. I can ask
for further information on the french newsgroup if you like, since
Rï¿½dacteur 3 is a French program.

Shared libraries might be a solution in certain respects, but remember
that NVDI 5 could also be a commercial shared library.

W_Dialog provides the system with some quite easy functions to open e.g.
non-modal dialog boxes. So it depends how the programmer use it. If you use
only the font selector you don't have to force people to use W_Dialog but I
guess Attribute uses Wdialog for the main dialog.
The other alternative would be to program the routines yourself or use a GEM
library. Both alternatives would increase the program size.

BTW, doesn't N_Dialog work for NAES?

Greetings,
Matthias

You don't need the disk to run your ST. It contains an outdated version of
Omikron Basic.

Nobody has to pay for programs like that. But if these programs are
commercial or non-free software you must not use them if you don't pay.
It is not legal to claim that you can use commercial software without
paying for it just because it is not developed anymore or because it has
bugs.

> BTW, doesn't N_Dialog work for NAES?

I think N_Dialog is missing some features of NAES. Maybe these can be added when thos that complain about WDIALOG help the author of N_Dialog. BTW, WDIALOG is free, isn't it? If I'm correct in this assumption its even more strange why people complain about ASH. Instead they should be happy that WDIALOG exists. The only purpose of WDIALOG is not to force users to use MagiC, isn't it?

What was "Omikron Basic" like?

All the ST language discs (admittedly either UK or US oriented) I've seen have either had ST Basic (either original or the Metacomco "Enhanced" version), or, if you go far enough back, you'd also get ST Logo.

(BTW: I've added "comp.sys.atari.programmer" to the newsgroup list, as this may also be of some help)

I don't believe it is written in order to make ppl use MagiC, but some
may not like to support it since it has had a history with many bugs
and still is not perfect. I have WDialog installed for the programs
that need it, but prefer not to support it when I write programs myself.

>
> What was "Omikron Basic" like?

Omikron Basic can use libraries (there were a lot of them e.g. the
Easy-GEM-Lib), can run with or without line numbers and has a
pseudo-GEM-Interface. However, at that time GFA-Basic was already too
popular. Omikron is more similar to the classic basic.
There was a version 5 with a GEM editor and horrible looking dialog boxes.

I forgot to mention that the decision to replace ST-Basic with Omikron was
made by Atari Germany - maybe because the Atari market in Germany was
different to the UK/US one.

Ofcourse not. That's why I don't buy MagiC, ASH mailer and thelikes.
With the exception of one program (Adamas) I always happely pays for
updates. You know that.

You're not exclusively bound on ASH. Maybe that makes the different.
Tell me why of all these exclusively ASH products not one single app
sees the light as freeware or whatever. Lots of people who doesn't have
the time or equippement anymore to develope their programs release it as
freeware. AFAIK, you did that also with Outside. Right?

Agree. Programmers have much better things to do then reinventing the
wheel but couldn't they make their program accessible (with restrictions)
for those who doesn't use the latest version of NVDI?

Right you are, I'm not a programmer at all. Sometimes I wished I was.
Most programs which relies on w_dialog for printing and other stuff does
work without w_dialog so again why do need certain programs w_dialog in
order to start up? Magicism?

First of all I was talking about common GEM apps. For me it's very
logical ported Un*x stuff needs MiNT. But it's very unlogical GEM apps
needs a certain OS, be it MagiC or MiNT to run. As said I don't know a
GEM app which needs MiNT.
Anyway why do need Magic-users (Un*x crap) to run with MagiC? The
sources are there for free. Everyone can adapt then. So go ahead.

>wrong about that? Everybody is free to chose the platform he wants.

He also said -and that's my opinion too- that there is nothing wrong
about people migrating to other platforn, *BUT* that most people
(luckely not all) using these emulators doesn't support the Atari scene
at all. On the contrary I should say. Lots of these emulators-users are
only interested in free stuff (or illegal copies). That's the reason why
I left years ago an local Atari club. With the exception of three people
the rest were using emulators. On meetings they were only talking about
pc problems. The true Atarians were tolerated because they thought they
could use us as a source for free Atari stuff.

For a good understanding, I'm not saying that all emulators-users are
acting like this. There are emulator-users who still supports the Atari
scene but they are in the minority.

> for those who doesn't use the latest version of NVDI?

It's a matter how much you have to change. Making the program accessible for
users without a certain system extension requires additinal programming
code. It's not only a matter of memory - the program code gets more complex
and therefore more difficult for the programmer to maintain.
It really depends on the function the program uses.

> Right you are, I'm not a programmer at all. Sometimes I wished I was.
> Most programs which relies on w_dialog for printing and other stuff does
> work without w_dialog so again why do need certain programs w_dialog in
> order to start up? Magicism?

Wdialog offers three main functions:
- Window dialogs
- Listboxes
- Font selection
- Print dialogs (Wdialog doesn't print it only offers the dialog)

Now, font selection and print dialogs can easily be replaced or disabled.
The first two are much more complicated.
Another problem is where to stop? You'd have to make replacements for users
without NVDI, BubbleGEM, OLGA, WDialog/MagiC etc. . Then there's also
SingleTOS, Geneva, N.AES, MagiC...

What I don't like are programs which simply check for a MagiC/MiNT cookie
and then refuse to run.

Greetings,
Matthias

> Do you think they will answer?

I don't know. But you cannot simply say ASH forced them to do something
without verifying this. I, on the other hand, can say that I know ASH
did not force them because I did talk to them.

> You're not exclusively bound on ASH. Maybe that makes the different.

No, it does not make the difference. With DISKUS and OUTSIDE I was
exclusively bound to CCD and Maxon, resp. And there was nothing wrong
with that. These firms had a lot of work to do with printing manuals,
advertising etc., which I could not have done. Distributing software is
simply a lot of work you cannot do on a large scale besides being a
student or having a profession.

> Agree. Programmers have much better things to do then reinventing the
> wheel but couldn't they make their program accessible (with restrictions)
> for those who doesn't use the latest version of NVDI?

I don't think so. NVDI (actually GDOS) has so many sophisticated
features that not using them would make the restricted version unusable.

> Right you are, I'm not a programmer at all. Sometimes I wished I was.
> Most programs which relies on w_dialog for printing and other stuff does
> work without w_dialog so again why do need certain programs w_dialog in
> order to start up? Magicism?

No. The programmers (but not ASH) for reasons already elaborated used
WDIALOG as a basis for their software.
A solution to this is not really complicated: N_DIALOG would have to be
completed so that it provides all the functions WDIALOG provides.
Considering the fact that N_DIALOG and WDIALOG are quite small this
should not be very hard to do. Wouldn't this be a project with more
potential for success than writing new browsers? Actually a new browser
could then even profit from WDIALOG/NDIALOG.

And you would also pay more for other programs that would be more
expensive for the same reaons? Note that in the end (with only two or
three programs) you would spend much more money than if you had bought
NVDI 5 in the first place.

I don't think those who own an ST/STE will like this attitude.

Again where have I blamned ASH for this? This way you can discuss for
ever.
All this could be avoided if some Magic programmers weren't so
evangelistic. There is no reason whatsoever why w_dialog is needed to
launch a program. Cab, Phototip, etc starts up without w_dialog.

They surely will not like this alltitude, that's for sure. You posed you
question directly to me. Personaly I don't bother.
I also don't think Papillon would be that bigger but I'm not a
programmer so you can tell me everytime what you like I can't check it
if it's true or not.

Or find a lib that does similiar things for you. Or implement the
functions into the AES.

> Considering the fact that N_DIALOG and WDIALOG are quite small this
> should not be very hard to do. Wouldn't this be a project with more
> potential for success than writing new browsers?

This can hardly be seriously meant, can it?

You really wish them to fail with the browser don't you? Of course it
would be easier to finish up a wdialog thingy for naes/xaaes than
writing a browser, but so would a lot of other less important things be
too. Personally I can start formating floppies instead of writing a
browser, that will probably turn out just fine. (this is a sarkasm, but
you seem to know how get along with those)

> Actually a new browser could then even profit from WDIALOG/NDIALOG.

A browser would be able to use it for the gui stuff, not for the
rendering engine as far as I can see. And since it would make more
sense to start with the rendering engine it would be better to put all
efforts into that instead. At least for those involved working with the
browser, I am sure there are others who could start the work to improve
n_dialog....

I am not saying that fixing n_dialog would be a bad idea, just find it
remarkable you feel the need to be all negative about browser projects
any time you can. I am beginning to think you are getting involved in
arguments just for the sake of arguing... But if arguing about
potential future browsers one could expect you to at least have heard
about the Highwire project....

"Truemagic" (not related to MagiC) - it's a shared library that has more functions than WDialog. It's disadvantage is however that all users would have to download the shared lib. I think there are also the sources available for that one.

BTW, I think enhancing a shared lib can make software development easier e.g. built-in JPEG/PNG display abilities.

Greetings,
Matthias

Ah. From the postings in this group I got the impression that this
WDIALOG issue is important for several users. If this is not the case,
fine.

> I am not saying that fixing n_dialog would be a bad idea, just find it
> remarkable you feel the need to be all negative about browser projects
> any time you can. I am beginning to think you are getting involved in

I'm not against browser projects in general. All that I am saying is
that projects as huge as that are likely to fail because there are not
enough programmers left to finish such a project and not enough users to
finance this, which was asked in the poll if I remember correctly.

> arguments just for the sake of arguing... But if arguing about
> potential future browsers one could expect you to at least have heard
> about the Highwire project....

There is no need to have heard about this project in order to say that
huge projects for the Atari are likely to fail and keep people from
concentrating on smaller projects that might have more success.

It might not be prohibited anymore to export strong crytographie. At
least there were several changes some months ago, e. g. Netscape may be
exported even with strong crytographie (128 bit) as far as I know.

Source record: 43373

> >It really depends on the function the program uses.
>
> I don't think 'attribute' offers lots of functions.

I wasn't talking about the functions attribute offers because I know it's a very basic utility :-)
WDialog/NDialog/MagiC has 15 extensions to the AES to handle window dialogs, events and iconify. It's not that you can display a non-modal dialog and handle events (mouse clicks, buttons) with one command. In fact you'll need almost all 15 in most cases. Without the Wdialog extension you have to program a substitute for each of them.

If I build a basic program in faceVALUE (which does not use Wdialog) with the same functions as "Attribute" it would result in a program that consists of 98% library code and the rest is the program code.

The problem is that TOS has no built-in support for modal dialogs. That's why we have now dozens of GEM libraries. It's also strange to see that programs with only 2-3 lines of program code (like "Fahrenheit" :-)) are blown up to 50k in size because of their GEM lib.

The ideal case would be that the operating system offers all the features of the GEM libs so that the programs only carry a minimum GEM lib with them. I'm not saying that the features introduced by MagiC are the best solution but they are currently built-in into two operating systems.
There is another shared lib which was developed independently from MagiC but it suffered obviously from the fact that everyone has to download the lib.

Greetings,
Matthias

That's true. Thing 1.27 can't handle very long file names. I usely
resolve this via the shell with 'mv'.
AFAIK, that bug has been solved in the latest Thing beta. Only I wished
the author would release it. I don't know what is keeping him up.

This thread is going to look like baby talk.
For the last time. I hope you have your eyes open now.

1) I said that I believe ASH force the programmers not to release their
soft. Still not convinced.

2) In another postings (e.g. Message-ID: <3b574654410a300@pandora.be>)
I stated that I could understand why programmers uses w_dialog but that
I couldn't understand why some programmers force others to use w_dialog.
So where have I accuse ASH?

Matthias Jaap did explain the reason. All what you do is given me a
meaningless answer. Are you a politician? If not you maybe could consider
to go in politics. You certainly have the skills to talk for hours without
saying anything.

Hi Martin,

I am using Thing 1.27 on my Milan. I never know if to call it
Ming or not.

I know of two problems with this version. The first is trivial.
When the Milan boots and the Ming logo is displayed in the
centre of the screen the graphic is missing from the centre.
I think it is due to the English RSC file I am using.

The second problem is more serious. AFAIK Thing 1.27 cannot
handle long filenames > 32 characters. I have been sent files
with such filenames and they cause TOS errors to be reported by
Thing when accessing the partition. Has this bug ever been fixed ?

I had a look at the Jinnee demo and found that I could delete
these very longname files. I prefer Thing though.

Regards,

Peter

I believe that the restriction is on exporting of the more secure form
of SSL outside the USA.

The less secure (64 bit?) version is not a problem AFAIK.

I did ask Dan Ackerman about SSL and he wasn't sure what the situation
was either. Though as others have pointed out, Mint-Net is available
and uses SSL. Maybe the Mint-Net developers could enlighten us as to the
status of SSL ?

Well, I downloaded and tried V-Trax. It looks nice, but I can't seem
to get it to use the FDI as the input source. I set it to FDI, and
make sure the small "input selector knob" is set to digital, but I get
no signal. Recording through the Falcon's input works though (which
as mentioned before, is useless to me).

I've also made sure to run FDI_INIT.PRG. It's strange since the
original "Studio Son" works great with the FDI, and it seems to share
a lot of similarities with V-Trax. Any suggestions?

I guess I would suggest you build it based around the Timex Sinclair
ZX-80...That's worth $300, and it's really powerful too!

Might be important to some people, I never said anything about that,
but it is hardly more important than a decent browser for the atari.
But do go on twisting my words...

> I'm not against browser projects in general. All that I am saying is
> that projects as huge as that are likely to fail because there are not
> enough programmers left to finish such a project and not enough users
> to finance this, which was asked in the poll if I remember correctly.

Yes it WOULD be a huge project, so the sooner something like that is
started, the faster there MIGHT be something coming out of it. And if
there would be a browser, I definitely think it would keep a few ppl
from switching platform. It is one of those projects that could make a
big difference for crying out loud!

> There is no need to have heard about this project in order to say that
> huge projects for the Atari are likely to fail and keep people from
> concentrating on smaller projects that might have more success.

Well if it will fail or not is something that lies in the future, and I
think we will still see smaller successful projects around even if ppl
would get involved in browser project. Better take a chance than just
give up, like you are suggesting. You keep on talking about realistic
this and that, but what you really are doing is spreading negative
thinking if you ask me.

Btw, since you have no positive visions in your crystal ball to share
with us, why are you still working with ataris?

2113. SoundPool's Audio Tracker

Newsgroup: comp.sys.atari.st
Date: 2001-07-21 05:49:46 UTC
From: nurmix@spam-free.com
Message-ID: <3b59169b.2245919@news-server.socal.rr.com>
Source record: 43382

Well, after having it recommended to me by a couple people here, I downloaded the demo version of SoundPool's Audio Tracker. I was pleasantly surprised by it's performance, features, and looks. I think it might work out for me as an addition to Cubase Audio, when vocal tracks are needed.

Anyway, now the only problem is that I can't seem to find it anywhere in the US. I haven't paid as much attention to the Atari scene in the last year or so as I used to, but did Systems For Tomorrow and chro_Magic more or less liquidate their Atari stuff? Seems like there isn't much on the sites anymore. Are there any other US or Canadian Atari dealers still around that carry SoundPool's product line? If not, I suppose I could try to order it directly from SoundPool themselves.

Any suggestions or help would be appreciated.

Mainly because there are users that have paid for my software and are entitled to get support for it. Most of the time I'm running a PC with Linux.

Obviously it is easier just to stop helping others when they have problems or questions. Most of those that quit the Atari scene in the past simply stopped all their projects at once. They virtually disappeared. No support anymore, no help in newsgroups anymore, nothing. Those that remain and still sell software, like ASH for example, are the black sheep now. Luckily it is only a minory of people in this group reproaching them to destroy the Atari market with being critical, claiming that they force programmers not to sell their software on their own etc.
Those still supporting their software have hopefully read this thread and have realised that sooner or later its them that will be the black sheep because nobody else is left.

I can judge it actualy, it asks foe wdialog and even with it, crash constantly.. For picture processind id vote or PhotoLine, backdraw may be that require FPU. Djpeg/cjpeg are just deapcker and packer, altough very good ones.. There is also Nview/Nconvert which knows some 200+ picture formats.

I respect your continued work a lot, even if your main platform has changed. However, I do believe the ones of us that are left must be entitled to some hopes for the future when it comes to important software like browsers or other big projects. Those initiating such things are the ones giving the rest of us a reason to stay atari.

I don't think ASH is considered being a black sheep because they try to be a commercial software company actively working for atari. I think what many says is unfortunate with ASH is their software often requires MagiC or/and iConnect to run properly. (I know there are exceptions) In the past it seems like ASH has not looked outside their own domains enough in the past, so therefore I think it is good to hear that they now are working on increased MiNT compatibility on GEMDOS level for next MagiC.

About the TCP/IP-stack problem we have nowadays, couldn't that be helped if there was PPPD under MagiCNet, allowing MagiC users to get MiNTnet compatible connection? It would be perfectly possible to initate a project to code an emulating bridge between MagiCnet/iConnect, to allow programs requiring iConnect to run happily in the future. I think we need a standard that both MiNT ppl as well as MagiC ppl could adhere to.

STiK programs runs happily under MagiCnet with the help of GlueSTiK for MagiCnet, so I say if the emulating bridge would be written, why not go for MagiCnet? (This is probably something for a different thread though ;)

I do think it is great to see commercial software being produced for atari in year 2001, but I would not want to have to use a certain OS or

TCP/IP-stack to benefit from it.

/Joakim

From: Rory Street <rory@atheniaglobe.com>
Message-ID: <9jbpgehqi1@uranium.btinternet.com>
Source record: 43395

Just in case none of you knew it you can get a free Atari ST emulator at http://www.emulators.com/ all you need to do is get hold of a copy of Atari ROM's if you have a copy of MAGIC you can use the ROM's from there and just take them off the disk otherwise they provide you with software to copy the ROM off an ST.

Most features work with it even the modem ports work which is good. And you get a free bit of software called GEM explorer to allow you to transfer information from Atari ST and MAC disks to your PC.

The nice thing is the same software (slightly different version) allows you to emulate a Mac on your computer.

Source record: 43297

Is there anything like Windows (norton/Volkov/whatever) Commander running on the Atari, ahem with MagiCMac ? There are various archive programs (shells) like Twoinone, STZip, with the two filelist window, but what about a file utility ? Maybe Kobold, but does it work with MagiCMac ?

Best it would be an open project, and put in comparing directories and other features. I'm ready to put my hands in such a project if you can give a starting point, as I do not have so much time to start from "Hello World!".

Ciao, ** *Mike* ** www.interware.it/users/mike/

2127. Scanning DPI?

Newsgroup: comp.sys.atari.st
Date: 2001-07-21 15:06:13 UTC
From: bindon@madasafish.com
Message-ID: <tlj6j5sblpmib3@corp.supernews.com>
Source record: 43299

Hi All!

I need scan some pics for my website using GT Look 2. I'm trying to think what DPI I should scan at. Is it better to scan at around 100DPI and 50% to make it roughly the right size for my website or scan at 50DPI but 100%?

Also would a better result be given if I scan at a high (320DPI) resolution then half the DPI. I can't see how to do this in Imagecopy 4?

Scanning is done in 24bit colour and after processing would be converted to JPEGs. It would be nice to have the image quite sharp.

Thanks!

>
> The less secure (64 bit?) version is not a problem AFAIK.

Again, I think that it's the use of the more secure mode that is (or
was) forbiden _in USA_ only, and this is why it was not released by the
author of the ovl himself.

Bye,
/Pascal/

Sure but others must also be entitled to say that they don't believe in
the success of certain projects but think that the time spent for this
projects might be better spent on other issues.
What I find very annoying is if users (not you) start telling fairy
tales about the relationship between companies and programmers who
decided *on their own* that they wanted somebody else to distribute
their software.

Hey everyone,
We've been working pretty hard lately getting everything ready for the opening of Europe Shareware North America, which will officially open this Monday! Currently, we carry the complete Europe Shareware catalogue, but will further expand it in the future to fit the needs of our customers. Anyway, if you haven't registered your shareware or bought any new programs lately because you did not want to deal international transactions, you should give ESNA a look. We're non-profit, so our prices are very competitive. (American and Canadian customers only please)

Using Papyrus, NVDI and a very large TrueType font [Bitstream's Cyberbit is
some 13MB big] I can see most Chinese and Japanese characters on my screen
[TT030/8 + 19"] but it gets terribly slow ;)

>I guess Denis does not refer to Unicode but rather multibyte codesets

Doesn't Papyrus's pseudo-Unicode format also have more than one byte per character?

> it, so I cannot remember the details, but it has the capability to run a
> shell in a CoNnect window, and then you can run telnet, ssh or whatever
> programs you like.

Almost, but not quite...
In a Mint set-up, sometimes, but it requires a good bit of 'messing
around'
for 'several minutes' to get a connection and reset all your term
options manually each and every time on both ends of the
connection...and still,
it's prone to crash.

There is no plain telnet for STiK that I know of that runs on the
console of your choice *I.E. inside a VT52 or Term window*. They all
have some kind of terminal attached to them.

There is a plain Telnet for Majic, it only works with PPPConnect.
I've tried that in ConNect...I think I remember it freezeing the
system at least part of the time.

Source record: 43306

My usual Atari retail outlet informs me I'm
now an ASH orphan, at least through him.

Anyplace in the USA I can upgrade these titles?

HD Driver 7.61
NVDI 5.1
CAB 2.7
MagiC 6

In all cases It has been about 2 years since I
updated. I'm at least one version behind in them
all.

It I'm forced to go over seas for upgrades, and
they can't be done online. It would be nice if
one place could take care of it all.

Thanks,
Brian

My experience is that 030 versions aint much faster, that could be because I
use Magic, an purely 68000 emulator, but a FPU version usually screams.

I do hope this new version of Magic has some 030 bits in it.

Use tha ALT keys in combination with arrow keys and insert and clr/home.

Either get an original mouse (difficult these days) or buy mouseburster
from Mario Becroft which lets a PC mouse plug in. Or use a PC mouse on the
modem port, but it needs drivers and so auto booting games don't tend to work
if thet require a mouse.

HDDriver can be upgraded by the author Uwe Seimet and I think hes German.
Not too difficult, he'll probably pop up here or go to his website.
NVDI can be updated to 5.3 for free if you go to Atari Workshops site.
CAB, not sure, latest is 2.8 and I think there is little between the two
versions. Magic 6 can be updated to 6.1 I think, and Europe Shareware seem
to be opening a branch in North America so I think you're in luck. These
programs above (except HDDriver) haven't seen an update for some time, Magic
6.20 might be around the corner.

> to JPEGs. It would be nice to have the image quite sharp.

The question sounds simple enough, but it's more complicated than you
think! <G>

If you look at my website (link in the signature), you'll see I scanned
quite a few pictures. And the wiring diagrams came from the CAD program
that was used to create them (I think). I may have imported the CAD
drawing into a different CAD program to create the file. The pictures
of the finished aircraft are digital, and nothing was done to them. The
other pictures are either 35mm or Polaroid instant pictures.

First decision- Do you think you'll ever want to print the pictures)?
If so, scan them as if you would be printing and then modify as
necessary in a program like Photoline. Or do two scans at the same
time, one for printing, and one for the web.

As for the web pictures, some assumptions have to be made at your end.
One is the resolution you are going to assume the the person viewing the
page will be using, how big physically you would like the pictures to
appear on the page, and if you want on the fly scaling of the picture by
the viewer's browser. At least, I think you can make the browser
autoscale the pictures. I've only created my pages, and it's been about
a year since I made them and I can't remember for sure.

At any rate, making it a jpeg is the very last step you want to do. Do
all your color corrections, touch ups, sharpening, etc. on a copy of the
original scan, then save the edited version in a file format that will
retain the full range of colors. JPEG's will decrease the colors.

I could go into more detail, but I'll quit here. <G>

Then you need to design a 300$ box that kick ass compared to a 300$ PC, otherwise you lost before you even started pouring $ in R&D.

Make sense?

My best hope is Nforce/Duron for sub 500$ systems of really high design standing.

I think if the design can fit in a 6x3x1 inch format with a color LCD a few people would buy them. (Me included)
My casio PB1000 died, and I'm reduce to my 1liner PB100 .. a pocket 'amiga 500' would be a nice replacement.

share files and a net connection :
like the other ppll already said you can use serial/parallel or scsi
connection.
but you can also use a real ethernet connection and make your atari part of
the LAN.

A solution is possible. If you don't like to solder and make a PCB yourself,
you'll have to wait a while (a few weeks) till Elmar Hilgart makes his
available for public.

HDDRIVER can also be upgraded by Atari Workshop in England. In case you
are not yet a registered user of HDDRIVER your original HDDRIVER floppy
disk is required for the update. The current version is HDDDRIVER 8 and
more information is available on my webpage:
http.//www.seimet.de/atari_english.html.

Thanks! I'm more concerned though if scanning at 100DPI at 50% zoom or 50DPI at 100% zoom as they come out the same size physically but which would be better? I found that the best setting was gamma corrrection for 24 pin printer rather than the CRT options! The site is just designed to be viewed on a monitor. Or do I scan big at 300DPI and somehow convert it smaller with some utitility to get the file size acceptable.

Source record: 43323

Between 1993 and 1995 I made The Cheaters Digest, awarded a decent 76% by ST Format. I still have all the original disks but, sadly, no ST.

Short of buying myself an Atari, has anybody any idea how I can get these onto my PC?

From memory I think the disk format was fairly standard, with 80 tracks and 10 sectors. I don't recall putting any tricky copy protection on.

Thanks to all in advance.

HI, Lyndon,

First of all, go check out the site that Derryck mentions in his post. I've just done a quick glance at it, but it looks like everything I would write, you will find there. So my comments below are based solely on my own experiences. <G>

Lyndon Amsdon wrote:
>
> Thanks! I'm more concerned though if scanning at 100DPI at 50% zoom or 50DPI
> at 100% zoom as they come out the same size physically but which would be
> better?

That will depend on the material being scanned and the algorithms used by your scan software. To me, in theory the results should be the same visually, but technically they may not be an exact match. But if you can't see the differences, what difference does it make?

You could also scan at 100 dpi at 100% zoom, make color correction steps in Photoline (or similar), then reduce the size there.

> I found that the best setting was gamma corrrection for 24 pin
> printer rather than the CRT options! The site is just designed to be
> viewed on a monitor.

This is where you have to make compromises. As noted on the scantip pages, you have no control over the hardware and settings used by the viewer. I run a high resolution on this Windows machine, 1280 X 1024 24 bit. So I sized my pictures to be good at this resolution. (I figured anyone interested in my aviation services AND could afford them would be running in higher resolutions anyway.) So my pictures will be very large when viewed on the original EGA screen of 640 X 480. And they will even be large at 800 X 600. If I would have had the time, a better solution would have been to place smaller sized pictures on the pages, and let the user click on them to get a larger picture. But that is more work, and I didn't have the time. Except for the wiring diagram.

FYI, he mentions 72 dpi and "early Apple screens". He's correct, the original Macintosh monitor is 72 dpi, and the Mac is what got desktop publishing off the ground.

> Or do I scan big at 300DPI and somehow convert it
> smaller with some utitility to get the file size acceptable.

Photoline, or similar will make it smaller. Even when printing at 600 dpi, you don't need a 300 dpi scan if you are doing color or greyscale. 200 dpi is all you need, assuming you want the printed version to be the

same size as the original and you choose the right file type.

Win-95 can read DD floppies formatted with 10 sectors and 82 tracks. The
reason is that initially Win-95 itself came on floppies. I don't think
newer Windows versions have this feature any more, but I havn't tried.

Btw, I just formatted a floppy as above and put it in my Win-95 and it
worked fine. Be shure to keep the floppies _write protected_ as Windows
actually will try to write to the bootsector even if you only read from
them (sic!).

I think that most of us have some shareware on our Ataris that we use from time to time if not regularly.

I am sure that many of you have registered it or at least tried to.

A few years ago I tried to register as much of my shareware as I could via Danny and Joe Connor and I think that all my regular apps are either registered or commercial and paid for.

Registering the shareware didn't cost much and I felt much better having made a contribution to the development of these apps.

My suggestion is this...

How about nominating one week as "Shareware Week". The idea being that we try to get as many people as possible to register the shareware that they use.

As well as encouraging more people to register it may encourage the developers to continue their work. A sudden influx of shareware fees should brighten their week.

Maybe we shouldn't just restrict this to "shareware", if there is a piece of commercial software that you have long considered buying then maybe "Shareware Week" is the time to but it.

This isn't compulsory it's just an suggestion.

Peter

I just got a PDP-11. Those machines really *were* used for
controlling nuclear reactors. Amongst other things. Mine, however,
never did anything more glamourous than routing parcels for a
nationwide courier service.

Yes, I agree. I recently started registering my shareware apps, starting
with Aniplayer and AtarICQ. However some people just don't give a damn.
I would be nice if more poeple would register the soft to make them
know it is worth the time.

I did take some time out to read the stuff about DPI, so I'm thinking about
80 to 100DPI considering most Atarians use around 800*600 which is what
the site is aimed at.

>> Or do I scan big at 300DPI and somehow convert it

I see. I don't own Photoline, and for that matter hardly any art packages!
I recently got Positive Image so I'll see if that offers anything useful.
I was impressed with the results I saw of Photoline in Atari Computing
and what people are saying here so I'll check it out. I quite like
messing with images, especially now I have a Falcon.

The 030 version bombs on my Falcon either from TOS or Magic. I'm guessing
that to use the 030 prg, I need the FPU. I currently use the 68000 version.

At first I didn't like it! No games like ST Format, but I soon relaised that
there were better things to do on my ST and I still look back at them for
reference to some hardware stuff. And the price was good too.

That could explain things. I have Windows ME - it can read the directory OK, but refuses to copy any files. I'll find a Windows 95 box and have a go with that.

And how do you plan on contacting the authours. Most of them have buggered off and cannot be found.

Some have taken the money and run, leaving behind unsupported buggy translation software.

Other gem's i'd happily re-register for an upgrade have sunk into the programming dark beyond.

Maybe anyone who considers taking up this suggestion should post here and get others to share their experiences.

Can you fellows on the east side of the Atlantic help me with an early 80s question?
When I was in grad school in Mississippi, I saw on the Public TV channel (several times) two BBC series on micro computers.

One was called (I think) The Computer Program, and the other was (as I recall) Making the Most of the Micro.

Each was 12-13 episodes long.

I've tried here, through contacts with the Nebraska Public TV to see if anyone has copies, or where I could buy copies. Do any of you know anything about getting old BBC programs on tape?

Both series had the same host (a Scottish surname as I recall) and covered a number of different machine, but esp the one I don't have and would really like to have: the Acorn BBC computer.

Thanks

Roy

I have an opportunity to get an Alesis AI3 at
a really sweet price. This is 24bit A/D/A
converter with 8 balanced inputs and 8 balanced
outputs, thus converting all 16 channels into 2
optical/digital ADAT connections. It claims
to work with all 20 bit ADAT standard equipment.

Does anyone know if this would work with the
SoundPool ADAT box and CueBase Audio? Seems
like it should to me. Can the SoundPool ADAT
device still be purchased?

Thanks,
Brian

OK. Just do the math backwards. There's 800 pixels horizontally to deal with total. You've got this picture you want to display on the screen. But you don't want it to be the full width of the screen. Let's say you want it to cover a horizontal distance of 1 quarter of the screen. Horizontal position doesn't matter here. 1 quarter of the screen is 200 pixels, so you want your horizontal or X size of the scan to be 200 pixels when you are done. Measure the area you want to be displayed on the screen, lets' assume that to be a 4" width, such as a picture. 200 (pixels) divided by 4 (inches) equals 50 pixels for each inch of picture width. 50 dpi scan will get you that exactly, without excessive file size. You might even try a couple of scans with fewer dpi, then display them in your browser and see if it makes a difference. That's basically how I came up with the size of the pictures on my web pages.

I've got Positive Image also, but I don't remember if it will scale the picture. I'm pretty sure Imagecopy does.

I don't think PI can scale down pictures. Furthermore you can expect
lots of troubles on modern systems.
For instance if one use VFAT (MiNT) PI is unable to load the images. It
says 'Picture format not recognised'. Also it have troubles with some
TIF files. It supports only non compressed TIF. Gif isn't supported at
all. OTOH one will be able to load/save picture in PNG format.

IMHO the main drawback of PI is its slowlyness. Even on a Hades one can
see the picture loaded block by block.
I did a test with a 379.468 bytes PNG.
PI ----------> 24:16 (24 sec)
Imagecopy: --> 2:28 (2 sec)

On a Falcon it might be quicker as AFAIK it make use of the DSP. Anyway I
shaw PI once running on the author his Falcon. I didn't notice that it was
slow. That's why I bought me PI. Back at home it was a great
disappointment. At that time I was using a TT030. PI turned out to be
useless. Even now on the Hades it's still useless.

HTH,
Martin

Hello all,

I am having a strange online problem. Sometimes when sign on to my ISP, I cannot do anything. If I try to get mail or get on a webiste, the modem sends a signal, but no data comes from my ISP. There have been times that if I wait long enough while I am online, things start to work again. My ISP says it is fine at it's end. I though that maybe my ISP was upgrading the sytem, but they say no. When I am locked out, I can still get online if I use my wife's PC. Anyone know what the problem is? My wife thinks it is my modem, but if that was the case I should be not able to sign and get connected. This happens with both Sting and Stik2.

As far as i know i can still get brand new Atari/amiga rodents:))

I have tried these myself and they are pretty good:)

I also have the occasional second hand rodent in, usuall from ï¿½5+
depending what type it is etc:)

>sure youre not virus infected.

Almost shure :-)

This fenomema _is_ documented but not well known. To prove it do as
follows:

1. Format a floppy on the Atari.

2. Save the bootsector with FCOPYPRO or any other disk utility.

3. Insert floppy in pc and "open it".

3. Put it back in the Atari and save bootsector again to another filename.

3. Compare the two saved bootsectors with ï¿½gale and watch the difference.

4. Type in the "difference" in your browser and seach the net and you
will find others who have made the same finding.

>Lyndon Amsdon

And thats the problem, there are more people out there not giving a damn
than those who really care.

And guess, you can bet the ones that complain first about lack of
support are the ones that dont give it!!!

I had a major problem trying to trace down some shareware authors a few
years ago, before i took delivery of the 'former' LAPD' library. I go t
a couple to allow the software to be releases as pd, but most others
disappear without a trace:(((

If there are any shareware/licenceware authors that have had software
distributed by LAPD public domain library, please get in touch. Or new
authors.. you never know:))

Windoze 98/se can read extended formatted disks.

What i do is use a program called DC format 3.0 to add an ms-dos
compatible bootsector, and then can read AND write to the disk with no
problems.

For normal use I tend to format the disks via windoze and then transfer
files via floppy that way.

If the disk have a few files you could try GEMexplorer, which is part of
the gemulator system, they do have a trial/limited version for people
who dont have the genulator, but htis only moves ONE file at a time. IT
does read all Atari disks I've thrown at it.

Alas. No. Can't gove you any pointers on getting copies. I don't know if the
BBC even still have copies of it.

You could always enquire to the BBC itself.

Here's another one: use a newsreader that uses a decent maximum
line-length, but you don't give a hoot for good netiquette, do you?
All you want to do is troll.

Dennis,

Maybe I'm missing something here, but where are these
incompatibilities? I really am not that familiar with MagiC (I've
seen it run, but that's all. I think it's a great OS.). I am familar
with MiNT on the user level, but I don't really know what's going on
in the innermost parts of the OS.

Anyway, I've used quite a few programs with my Atari and I've never
really seen a problem. I run Atari AES 4.1 on top of MiNT, but I also
use the command line in a console window. I've demoed quite a few ASH
applications, which I would assume would be designed towards MagiC and
they've always run well! What exactly is incompatible between the
operating systems.

Personally, I think the MiNT designers are doing a wonderful job at
keeping MiNT very current. I'm not saying MagiC isn't modern, I'm
just saying they both are, but they are in different ways. The MiNT
programmers are doing a great job bringing MiNT closer and closer to
POSIX standards while miraculously maintaining a high level of
compatibilty with the original Atari TOS. They have allowed a lot of
UNIX software ports to be done on the Atari, which is a good thing in
that more software is available. I know some people have different
opinions about porting software and I can understand that. From what
I understand, MagiC is also a wonderful operating system and has many
benefits beyond MiNT.

I know there might be some small incompatibilities between the OSes on
the Atari, but the Atari is a unique hardware/software platform in
that all the OSes are more or less compatible. Most programs (not
counting games and software with direct hardware access) can run under
Atari TOS, MiNT+MultiTOS, MiNT+NAES, MagiC, Geneva, MiNT+Geneva,
MiNT+XaAES, etc. And a lot of differences exist in the approaches to
design in each OS, but they all manage to be compatible.

I don't think another platform offers this amazing feature. Take the
PC. A whole bunch of OSes exist, but, in general, programs cannot be
simply run under different OSes on this platform. A Linux program

cannot be directly run under Windows 98 and a Windows NT program can't be run directly under OS/2 or MS-DOS. There are different flavors of DOS, which, in a way, mirror the Atari situation.

I think we should applaud the programmers of MiNT as well as the programmers of MagiC for keeping this compatibilty. MiNT might be moving in a somewhat different direction sometimes, but the basic compatibility will remain.

Does anyone else have any thoughts on this subject? I've always found the compatibilty in different Atari OSes fascinating.

I was just defending the MiNT programmers. I don't think they're ignoring MagiC development, I think they just have some other goals as well as maintaining compatibilty.

I do think I have a highly simplified argument, however, since I don't have the slightest idea what a thread is for other than sewing on a button ;-)

tin has versions for Amiga and Win32, but the former is a bit old and
the latter needs cygwin. Besides, tin is too un-Windows-like for
Stephan to use. He prefers to inflict Outlook Distress on everyone.
The worse it posts the happier he is. He'll be posting in HTML soon.

I haven't tried compiling a new version of tin under AmigaOS. It
might be interesting to try...

slrn 0.9.7.1 was fun!

> But then you can get a 750mhz similare core (Duron) for 25$... thats your price.

A notebook CPU costs more than that, heck I can't even find a price for
comparison. You just couldn't use one of those furnaces in a book-size
unit.

> I dont see the point in using a much slower chip like the transmeta crusoe for a
desktop/booksize PC.

But it would be a HELL of a lot faster than the 68000/Timex
Sinclair/6502 relics others are suggesting, and it runs without a
heatsink. You ever felt the CPU in a notebook? imagine the temp a

thunderbird would be!

> just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver
> 46 sysmark2000 , a 500mhz P3 laptop deliver 115 sysmark2000.

Thats under the x86 codemorphing layer with the optimizations set to
"don't cache code", The Crusoe is a tricky beast to benchmark,
especially against it's own codemorphing layer. The codemorphing tends
to cache the benchmark loops giving unrealistically high scores, so for
simplicity, it's turned off.

> > Can you imagine UAE ported to Crusoe as its code-morphing layer?
> > incredible.
>
> No so sure about that...

It would be wild, a codemorphing layer that abstracts a 68040, and the
chipset! come to think of it, I wonder if UAE would even be needed?

> > Modules could be made for just about ANY old school CPU/platform, and an
> > OS wouldn't need to be developed for it, as it could run these platforms
> > OS's natively, maybe even in addition to a custom OS.
>
> Their is already so many core running on the x86... From the most obscure to
> C64 & amigas.

But those are "emulators", Crusoe's codemorphing is a much different
beast, even x86 is just "codemorphed". c64/Amiga's are running on top of
Windows/linux on top of x86. The Crusoe wouldn't need a host OS.

> > Marketing would be a piece of cake, as you could use it from anything
> > from a Kiosk to a webserver, an Amiga emulator to a Unix portable.

And it looks like they beat me to it, it's now available, albeit at a
higher price, running linux 2.4.5 w/Netscape 4.7 (shudder)

> > Computer do alot nowdays in term of multimedia because of the power they have.
> > I'm not so sure intel/amd etc.. just develope for people to run half life at 500FPS.

On the contrary, they'll market them for dumber things, like Intel
saying it's "New Pentium 4 processor will enhance the web" and going
on about how the internet will be faster. I always get a kick out of
that :)

> > Linux Geeks would love it! (if only because Linus works for transmeta).

> Run x x86 version of the major OS... run Ti calculator or c64 class stuff under emu

Because emulation would /be/ low performance, the Crusoe running a
platform under codemorphing is faster than any emulator I've ever seen.
Show me an x86 emulator that can run Windows faster than the Crusoe can
under codemorphing/x86. Remember, this is a hobby box, if I want to toy
with an OS, I want to run it natively, (or a codemorphing facimile
thereof.)

Plus it's upgradeable (the codemorphing), meaning the platforms it can
morph will increase over time.

> > The market could even be expanded to commercial vendors, it would be a

> > you couldn't make this thing do.

> You would need native code to do software encoding on that chipat a decent speed.
> Who would write all that code?

In the case of the Tivo, it's already been written. the Linux/x86
package is already available customised for the Crusoe, tailored by
Linus Torvalds himself. In the case of the Satelite reciever, you can
find the GPL'ed code from a link off of www.satmatrix.com. Kiosk
software has already been made available for the Crusoe under GPL, so
has PDA codemorphing for the Palm platform.

The beauty is, if code isn't available, as long as you can produce the
codemorphing layer, you just reuse your existing code! Case in point,
Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't
x86, it simply pretends to be through abstraction via the codemorphing.
Hence Windows can run "natively" on a CPU it isn't written for.

> > R&D required? very little, the hardware is ALL standard, and already
> > made, produced, and sold, not to mention it already has HUGE "geek
> > mindshare."

> Cant that be said for the x86 platform?

Only for the case of x86 hardware meant to run x86 software, the Crusoe
isn't limited to x86.

As for the "Geek Mindshare" I think a Crusoe captures more mindshare
among the HW geeks than x86 does.

I often find that I can get online with a PC where the Atari refuses to
tread, and its a mystery to me.

I was trying to make the point that peop's should check other users
experiences first, to ensure they are not buying something that is known to
have shit support, without their knowing first if the relevant registered
version would be fit for their needs.

There's stuff I've registered in the past that looked good based on the
demo, that turned out to be shitte.

And the Ohio Scientific systems, and the Apple II and, and, and...

Actually the OSI BASIC was an excellent little interpreter. With only
6 digit floating point precision it was extremely FAST (who cares
about .000001 accuracy- I was just writing video games), it was
easily extensible and it only had a few bugs.

Those were the "good old days" when Microsoft was your friend.

It all depends on how your ST disks were formatted (by that I mean
what version of TOS was in the machine that originally made them.)

Early versions of TOS had a bug that prevented PCs from reading disks
they formatted, but since you indicated you can read the directories
on the disks, this probably doesn't apply.

If you still can't read them, there are some (old) DOS based programs
which might help IF you can find them.

"ST2PC.EXE" and "STTOPC.EXE" (which may in fact be variations on the
same program- it's been that long since I've even seen them) are PC
programs which will READ files from ST formatted disks, and let you
COPY the files onto the PC's drives.

You can't access the floppies directly from Windows using these
programs, you must copy the files onto the PC hard drive first using
the program.

(I'm going to have to see if I can find either of these programs, as
this question keeps coming up. I know I probably have them on a disk
somewhere, but locating the disks would take longer than searching the
web.)

Good luck!

Uwe Seimet <us__nospam__@seimet.de> wrote in message news:<3B59A419.64EDFA4A@seimet.de>...
> Sure but others must also be entitled to say that they don't believe in
> the success of certain projects but think that the time spent for this
> projects might be better spent on other issues.

I think Uwe makes a LOT of sense here.

I joined in the poll and stated that YES, I will pay 50 to 100 US
dollars
for a vastly improved browser. I never had any problem with paying
for each
step up that CAB made either. The fact is, there are smaller
immediately USEFUL things that must be done before that dream browser
comes to be. Places where success CAN be had in shorter spells of
time. In time, maybe the pieces
will fall together allowing more rapid development of future
applications.

Something I feel that at this time would be much more useful than a
browser,
is gradual improvement on the programming tools, and OS extensions,
and an effort to get these tools into the hands of every day users.
An example of what I mean:

My introduction to C has been simple and fun, useing text only
applications
on a unix platform that are quite powerful thanks to the fact there
are
tons of calls avilable that I can understand and don't have to write
from
scratch. I.E. In my talker (amnuts) code, I don't have to understand
all the intricate details of the networking sockets...I can simply
vwrite() a line of text to a specific user...the compiler figures out
everything else.

In time I've built alot of generic functions of my own. So...here I
am
knowing NOTHING about TCP/IP stacks, yet I'm already writeing code
that
can communicate with 50 or so users all connected to the same
interactive database at the same time and address data belonging to
all these different users at the same time, yet I've written the code
as if there's only one user on one connection. It's simple stuff to
me because the tools take care of the complex issues like connecting
and booting users, laying out a file format for the disk drive,
setting up globals and buffers, etc.

I can take this same code on my MintNet Falcon, and the libraries simply don't
exist! If I do get it running, it's after disableing basic things, like
ansi characters or color support, scrolling features, and basic stack calls
like getipaddress, or lcrypt, etc...

Here we are dreaming of fancy browsers with java script support, yet the majority of us are still stuck with a VT52 console to work from. I'd love
a nice browser! But to be honest...I'd do back flips and pay twice as much for
some basic utilities like...a VT102/Ansi color terminal in a window to replace
the usual buggly/slow VT52 ones. I'd really drool for some libraries that would allow a beginner programmer to start out compileing simple ttp apps that run in these windows, wich could later have AES type environments built for them.

And Atari software always comes SO CLOSE to the mark...to the point of only
needing some polishing or small features added, and then it just stops cold with remarks like, "Why do you need VT102 that isn't slow as molasses, only works if you boot a certian way and hold your mouth just right, and actually works with standard termcaps without takeing 20 minutes to manually initalize and set up every time you want to use it? You don't need to be able to run vi on a remote system without spending an hour each session dicking around with display options and still not being able to get half of it working! Why don't you network 7 machines together, and from your 1st mint one do this, and call your isp and demand they change that, and use your 5th machine with the CT7 and snoopy's super screen hack to get a partial implimentation of VZ12 wich is ALMOST VT100, but you still won't get color or scrolling unless you invert the termcap on your 5th machine, but then it will give you German only menus, etc...etc...etc..." Oh, if you can't this running, you're an Idiot!

This example was not a problem when ISP systems still offered a direct connection into a unix account. I could still use a direct dial in term from 1982 like InterConnect or Flash or STalker or CoNnect or STorm, all with FINE emulation, XYZprotocols, and more.

With that in mind...
I won't be expecting any browsers. The code that would take an experienced programmer a single weekend to toss together is considered a waste of time, while it seems to me such things are the rudiments to developing an evironment
where programmers can quickly progress with features and knowledge.

Things like NVDI, and HD Driver, basic emulation protocols for terminals ARE the foundation that makes larger projects like a web browser progress much more quickly. Such developments also make it

possible for less experienced programmers to begin adding useful applications and updates to the pool.

So, while I'd be happy to pay $50 or so for an improved client side browser, that is a minimum of 2 years away, I'd pay $200 TODAY for something like TeraTerm or ProComm, that supports the STiK/STing stack and ANY load of TOS/MajiC/Mint/Geneva/etc. I'd support a good development package...the last one I could get my hands on is Mark Williams C...it crashes my Falcon! I'm still 'working' on getting mint up to date.

I'd pay up to $500 for something that worked inside GEM somewhat like a remote
Xwin term. There's your browser people. Let a remote ISP unix box run
the browser and convert the display into something quickly/highly GEM displayable...have the Atari simply translate and display this output. In terms of bandwidth, a screen full of data is a screen full of data.

Just a few ideas...
And yes...Uwe makes a LOT of sense.
It's kind of silly to insist on a full fledged browser when we still don't even
have mere basics solidly in place yet.

As for ASH, I've found that products I've purchased from them have been worth
the asking price at the time of delivery. No different from buying a guitar
or a tuba. I was told what it CAN do TODAY, given an opportunity to test drive it, and the price for it. I paid it, and have long since gotten my money worth from it. It is outright silly to think ASH affiliated authors are oblidged to GIVE AWAY their code if they choose to discontinue support. You'll also notice the price usually falls in half and manuals often go from paper to some Eformat when a title goes dormant on support, and all kinds of efforts are presented to make CLEAR you get the version AS IS. As the code drops further behind, I think you'll also see the prices asked for it drop in due process.

Also...I think you'll find that there is not a hudge profit margin for ASH in bothering to deal with any of this Atari stuff. For every meager sale they make, they have to turn around and reinvest it in publishing services and royalties, etc...

If you purchased CAB 3 years ago for $50 bucks...and used it three times a week
since...I'd say there's little to complain about. Drive a car for 3 years and tell me it's still like new or that you didn't get your 'money's worth' from it.
Code isn't much different really. And stack your arguments any way you like...
no platform is immune from this analogy. At some point you make a

choice to
live with what you have, or buy your way out of obsolesence. Try
installing Windows ME or MacOS X on a 10 year old system. It ain't
happening!

I also enjoy Mint...
It's a different way of doing things and little improvements are made
every day.
As the small 'innovations' of the 'basic' things add up, that nice
broswer will be closer.

Rest assured, NOTHING is really free. Often what cost a few bucks
saves
a lot of time, and vice verse. If you're doing serious professional
work
with your machines...service and upgrades will eventually cost
you...six
of one, half a dozen of another.

Brian

Actually the 750mhz part should run 'cool', also you can run it at 400mhz and remove on
chip active cooling?.
I put 533mhz celeron in booksize computer and they where fine. a 750mhz duron would be
```

cake.

Yes, I would choose a rusoe over a 68000, no problem here.
For low power... I kind of like the strongarm.
I dont really have a sweet spot for transmeta effort, I dont see where it really fit in the
market.
I also see that they are not doing well at all... Could be riding the economic wave, or
just problem
grabing some of the cpu market.

>
> > just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver

In the end , MMX/SSE/multimedia/3d stuff will probably run many fold faster on a slower mhz
p3
then a crusoe chip.

At this point I would guess that a mobile p3 can render more then a crusoe using the same
amount of
power... Using less power ut performing less is not always an advantage.

Their is a diference betwen reformating code (UAE is already doing its own type
'codemorphing')
and doing cycle precisise timing on virtual register set of custom HW on top of that.
Their is alot more stuff in UAE then what transmeta is doing, thats why I never caught on
the hype.

>

Does codemorphing support handling of strobe registers? I dont think transmeta
support emulation of something as complex as the OCS HW register set.
The floppy controler register would need 'HW logic' emulated... etc... Not an easy task.
So you would need to show big revenue to spend all that R&D to emulate decade old HW.

> > > Computer do alot nowdays in term of multimedia because of the power they have.

It run flash smoother, it handle better codec like mpeg4 and real, complex web page scrool
smother, it will give higher frame rate in complex java gfx applets, etc, etc...
So in effect, yes the web to an end user look smoother/faster... He can navigate a bit
faster,
scroll complex page with ease.
Use a DSL conection on a pentium clasic and then a pentium4. If you visite media rich web
page you will see a Dramatic diference.

So I can see people getting a new computer when they get braodband.

What OS worth anything doesn't run native on a x86? :)
And how much power do you need to get z80, 6502, 68000, etc.. emulation going on
a gigahertz clas thunderbird?

>
> Plus it's upgradeable (the codemorphing), meaning the platforms it can

I dont think they have yet to emulate a pentium MMX, they just emulate the basic 486?

What codec did Linus code nativly for the crusoe?!!?!?
Do you have a link on what is in a Tivo box?

>

Like UAE convert 680x0 to x86. I can take a fresh copy of Amiga OS from a box and
install it on a PC.
The thing is windows will expect some kind of common PC chipset/bios support if
its to ru nout of the box... I dont see the point. Get a mobile P3 to run windows, it
will be faster. Support native MMX/SSE at full speed.

>
> Only for the case of x86 hardware meant to run x86 software, the Crusoe
> isn't limited to x86.

Aside hacking a new processor, or fiddle around... why would anyone actually
morph to something else then a x86?
For example, can the sony laptop also run MaxOSX with a PPC version of the crusoe code
morphing?

>
> As for the "Geek Mindshare" I think a Crusoe captures more mindshare
> among the HW geeks than x86 does.

I'm a programming geek.. and I got loads of tools for the x86. I also love processing
power.
The crusoe is a just a processor that got its core designed to be emulator friendly... But
aside
emulation is doen't have much to it.

Again, I'm not a fan of that chip because I see no use for it in all common computing form.
PDA, laptop, bookside, desktop, workstation, server... All have better processor already
there for
the picking.

Stephan

2213. Re: SoundPool's Audio Tracker (and Analog 8 output expander)

Thanks for the information. The other day when I was looking, I tried to access the Wizztronics web site, and couldn't get in at all (just a page telling me I wasn't "authorized" to view the page - or something to that effect). I naturally assumed they were no longer in business (ha!). However, trying again tonight after reading your post, I did get in. The list all the SoundPool products (hardware and software), so I sent them an e-mail to find out if they have them in stock, and their prices.

Interestingly, SoundPool themselves have been very responsive and helpful in answering my e-mails to them. They have both products in stock, and the prices are pretty good too. However, they tell me that they won't ship overseas for a purchase less than 400EURO, as they say the "shipping costs are exorbitant". Seems a little strange to me, as I've both SHIPPED and RECEIVED packages to and from Europe from here in the United States, and have never had a problem from other companies, and never thought the cost was _that_ unreasonable. Plus, wouldn't _I_ be the one to pay the shipping anyway? Why should they care how much it is?

They did offer to sell me the software, and send it via e-mail (with a postscript file manual), but in my particular recording situation, the software _without_ the Analog 8 output expander is really almost useless.

Has anyone else here run into this when ordering products form overseas?

Anyway, hopefully Wizztronics has the products, and has them at a reasonable price. Otherwise, I suppose I'll have to look for a used Analog 8 here in the group. Anyone selling one?

Hi Janez,

>Same for memory access. Falcon (esp with let say ct60/pci where u may enjoy
>VIDEL/PCI gfx double monitor system) can run absolutely ALL what
>Hades/Milan can, speed depends on accelerator (one

Why do you give me an example of a non-existing configuration? The CT-60 is vapourware...

>info for u: my ct2 falcon loads jpg via DSP (aniplay) a fraction faster as
>Hades 060, altough hades did dither to 256c). Opposite that doesnt
>count.

Thanks for the info...what about a TIFF? the DSP isn't used for that format, software that doesn't take advantage of the DSP will be a lot slower.

>I can name u A LOT of examples what Falcon CAN do, clones will fail! Lotsa
>of those are really really good and powerfull apps! (incoming ACE, CAF,
>ApexMedia, ESCPaint, Mp2 (uses 0% cpu time), Mp3 (uses 18% on ct2).

You keep throwing Falcon specific stuff around my ears!! these don't run on the clones but will not run on a ST/STE/TT either...
Why not try a more realistic approach? i.e how long does it take Calamus to calculate and display a page, how long does it take Papyrus to reformat a document, how long is Photoline chewing when rotating a 10Mb TIFF? these apps are just as good and powerfull as your exemples, the difference of course is that these run on almost any Atari and clone.

>In short: I love Ataris, apps and feeling! Im not overhelmed and excited
>on bloody specs only! I NEVER regreted any penny is spent on Ataris and im
>convinced that PC user spent a LOT more as i did from 85 till today, 80%
>of his money was spent just to be "in" with new app versions and work in
>Word is not much quicker as it was few yrs ago, CPU's are faster a lot.

You understood me wrong... I'm not making an assessment here about the difference in price between Atari and a poxy PC... the point is that Atari hardware never was really cheap, the "Power for the Price" slogan was just a slogan..... one shouldn't compare the price of a Milan/Hades to a PC. The simple fact is that an Atari user has never been able to buy so much power for the price, how much or little money an Apple or PC user spends is not my concern.

>Did u actualy try Adamas? Its super stable, survive some 1-5mins till it
>crash.. Its good try, still not usable with such record...

Yes I did.... and I'm one of their biggest fans <grin>
I can make it crash the computer in exactly 5 seconds.
What you call a "good try", I call a miserable attempt...

>HDD acces? are u joking? I load Papyrus FASTER as
>my pal Word.. whats the use of faster HDD if app is 10 times bigger?

No I'm not joking at all..., let's change "faster HD access", in faster SCSI port... faster access means that one could burn CD's at for example 8 or 12 speed, scanning large pics would only take the fraction of the time that's needed now... one could finally enjoy the speed of his fast SCSI hard disk, which now is running like a crippled horse. This has nothing to do with loading an app faster, you should compare apples with apples, have you ever seen the Papyrus PC version? compare *that* with Word...

>P.S. I repeat: Im not against clones at all, Hades/Milan aint bad machine,
>for compatible that is.. But i still like Atari feeling, i want clones
>would still have some compatibility, id like ppl wouldnt just see damn
>MHZ/Pixels.. Its so damn narrowminded!

Not everyone here uses a Falcon, you've only given examples of Falcon specific software that takes advantage of the DSP... you like to see compatibility with a Falcon... the Hades/Milan are not Falcon clones.
And in case you forgot: Atari produced more then just Falcons... it's not really the best example either, the Falcon was not considered to be very compatible with the ST/STE, and as far as compatibility goes it is just as bad as the Milan/Hades. How many ST-demos can you run on the Falcon? Why do only a small fraction of the ST/STE games run on the Falcon?

Cheers from Belgium
Dennis

Hi Janez,

>U realy do this crap intentionaly do u? I would for example, if Adamas will
>reach usable stage, ill use it on my system, with ethernet (mintnet) and things
>i already use on my system

I don't do anything intentional. How do you expect me to seriously comment on
your statements? There is no usable Adamas, there is no CT-60, there is no way
IConnect clients will run under MiNT-Net....

>Reading your views i did notice all from ASH is ideal, and all other is crap.

It's not my fault that they have a good nose for good software, looking at the
list of software they distribute I can only pick Signum 4.4 as the weak one, and
I'm sure that some people will not agree with this.
Please don't twist my words, crap IMO are Unix apps which are ported to run on
this platform. I haven't used the word crap in any other context.

>Whats stoping them? Bloddy "Magic required" message from most apps
>stopping them.

Have you ever heard of threads? IConnect and most of its clients run in these
threads. Threads are offered under MagiC, but not implemented in MiNT. That's
the main reason why you see the "MagiC required" message pop up.

>i have 5 friends which are now Mac users.. All went excited way back with
>MagicMAC, get Mac's.. well fun lasted some time, now all xcept one are real Mac
>users.. Do blame community again.. do not bother to reply.

What are you trying to tell me? of course they were excited with MagiCMac, when
it was released it offered people a chance to run their beloved apps faster, in
16bit colour and an attractive resolution... When MagiCMac was released most of
the Atari applications were worthwile to run under it. Back then we had some
apps which were really amazing for that time. Someone who buys a Mac now doesn't
have an incentive at all to run an Atari emulator, except perhaps for Calamus
there's nothing which makes it worthwile.

We're back where we started: the software is missing.... keep on dreaming about
modern browsers that will beat Opera, iCAb etc running on antique 68030 based
machines...

>P.S scroll back and u will soo how all that start.. Mentioning Unix
>*CRAP*, Magic/ASH apps far superior bla bla, some thoughts about
>community i kepp blame.. i dont wana be part... And before u label me
>ASH/Magic hater, list all messages and seek for words *crap, bad, shitty*

>and so on...

There's nothing wrong with my memory...
I do have the right to have an opinion? In my view ported Unix stuff is crap.
You don't have to agree with it... I've explained why I think it's crap, you
have been pulling my replies out of context since day one.
What started this is me commenting that MagiC users are not waiting for Unix
crap to be ported to their system... I haven't seen many reactions from MagiC
users here who disagree, did you?

Cheers from Belgium

>>here last week...
>
> That promishes again lots of headache and fustrations.

Possibly, but most certainly not here.
I'm through with Draconis...

> My believe is that ASH forbid the authors to release their soft.
> It's the fault of ASH that the community doesn't appreciate the
> way they work. They have done everything to force people to buy
> their products.

I'm pretty sure that it's only a very small minority of the community which has such an extremistic view. All the software is still for sale, not a week passes by here without someone asking where he can obtain CAB, Texel, Artworx ...etc, so it's not realistic to expect the programmers to release it as freeware. Can you give me an example of a programmer who released his work while there was still demand for it? Blaming ASH for this situation is nonsense, they are the firm that distributes the software, it's the author who decides what happens to his software.
You've attended several of the German Atari shows, do you remember what firm attracted the biggest crowd? I never had the impression that crowd was forced by anyone. At some shows I had to stand for well over 40 minutes in line to update some of the ASH software. Nobody there was forced to update or buy anything....

> Even nowadays there are still some programmmers who force people
> to use that dreadfull w_dialog. Take for instance 'attribute'.
> Why one earth do we need w_dialog for such a basic application?

I honestly don't know. I suppose it's because the application uses a routine offered by w_dialog. It's not really important either... if you don't like the way the programmer intended it to run, then don't use it... just throw it in the trashcan. What on earth has ASH got to do with w_dialog? I can't see the connection... before the PDLG.SLB was introduced, w_dialog was needed under MagiC also.
BTW what is so dreadfull about w_dialog? a lot of people here seem to have a problem with it... it's simply a system extension, you throw it in the AUTO folder and forget all about it... :-)

Cheers from Belgium

Hi Martin,

>Lots of people are still using an older version of NVDI. If they wish to
>use Papillon they'll have to buy NVDI 5 also. This methode reminds me to
>the methodes Bill uses.

"lots of people".... ?? isn't it about time you think that these people get in to action and update their at least 4 years old version of NVDI? Has it occured to you that these people are partly responsible that development of NVDI probably has come to an end? If those people would have updated to the latest version it might have given the brothers B. an incentive to continue the development.

The previous version of NVDI is 4 years old, I think people have had all the time in the world to update. If they didn't update to version 5.0x then it's because they don't want to, they don't have to, nobody is forcing them to update, but to expect from a programmer to take this in account and limit his program just because these people don't want to spend money on an update is ridiculous.

Cheers from Belgium

Source record: 43287

Hello,

After a long period of inactivity (since February) on the CT60, I'm happy to
announce you that I took some decisions to be able to rout the CT60 board
and so arrive to the manufacturing of a prototype.
I obtained too that the manufacturer will produce freely for me, reducing my
development's costs.

As you may know, I'm very busy with the design of the new Riored-J, a nice
'alternative OS' PPC board that will surely be usable by the atari world
....
But it is no yet time to speak more about this...

I think that the CT60 prototype will be assembled during september 01...

I will try to put online some technical data about the CT60 production, like
schematics...allowing everybody to see the effective advance of the work !

'See' you soon.

Can you please suggest a benchmark program to calculate drive throughput ? I
am trying to understand the performanche difference using an Atari formatted
drive with MagiCMac and a "shared" Mac folder seen as a MagiCMac drive.

Obviously the program should olny do "legal" calls, writing and reading files
on the drive..... or should I write it myself ? In that case a starting
point for a C program is well accepted 8^)

Real newsreaders even let you change the line length as you type.

Well, I guess that should actually be, "real OSs," since the key to
that is being able to change prefs on the fly while you use programs.

Multitasking: try to imagine it.

I'll play about some but I think I'll do thumbnails as I
hate some sites that have a bunch of pics, all large on
the same page and you only want to look at one in detail.
My pics are 7 inch wide so if I want a thumbnail about a
quarter of the size of the screen (OK I have big thumbs :)
That makes, about 30 DPI I think for 800*600 on 14inch monitor.

Thanks, I'll give it a go if I have time, as I'm etching out a pcb :)

> use and for hobbyists. How would such a system look?

I may be late to the thread, but anyway...

I don't think that people will be willing to pay $300 for an appliance (as such a computer would be). You have to look at what the current market wants. There are a million and one Internet boxes (the Bush Internet TV is one at ï¿½79, or about $100) that do Internet, email, etc. Not much use for writing a letter or playing games though.

Assuming that you have been given a Government contract to make sub $300 boxes for poor people to enable the Internet revolution and increase education,etc (a realistic modern aim?) then what would you want?

Integration is the name of the game. So is simplicity. It won't have a DVD drive, but it will have a CD drive. It won't have a 40GB HD, but it might have end of line never-sold 5~10GB HDs. It will have built-in modem and ethernet. It will have built-in graphics and audio. It must display to a TV, but a monitor is an option. Expansion ports kept to a minimum (4 USB, no serial, parallel, etc). Internal expansion not necessary. CPU power needs to be adequate, not good.

If you are building 1m boxes, you would sign a contract with Asus/ABit/etc to get low end motherboards with the features that you want only, in the form factor that you want. Use a cheap processor (in quantity, the Via C3 would be good - I bet you could get 600MHz C3 processors in quantity for ~$25 each). Integrated motherboard would be $40 with a $15 chipset (SiS630) and minimal components. Hard drive would be ~$50. CD ~$20. No floppy.

Motherboard (+modem, network, audio, graphics): $40
Processor: $25
Hard Drive: $50
CD: $20
Case (custom): $20
Keyboard: $5
Mouse: $5

As for the operating system - a free one would make sense, however a simple for dummies interface should be employed. The Linux kernel

could be used, with a graphical interface that lets the user run applications and set up the device, but isn't a scary UI. Big icons on the screen, one for each application. Basically the Palm launcher I reckon. Modified applications could be used that didn't prompt the user about where to save the document, but just saved it safely, and when you wanted to open a document, it would just show the user the list of documents that they had previously created. Disable downloads from the Internet except from the device makers, where new apps can be downloaded only (use a special tool, perhaps).

On the other hand, just use a Pace Digital TV set-top box, with built-in PowerVR technology (a la Dreamcast). As non-digital TV will be eradicated in about 6 years anyway, why not lever a device that everyone will need in their house at one point or another?

Graham

I would also say that this was a great processor for a device.

> > As OS? (Linux is a dead giveaway, but there also other OS's out there)
> Linux, why not. .. oh yea. You mentioned userfriendly. so thats a nono.

Linux is a kernel. The "Gnome OS" and the "KDE OS" are not
userfriendly enough! Get the Linux Kernel (or FreeBSD kernel, etc),
get QT embedded or GTK/Framebuffer, and create a custom, Palm UI like,
interface that is simple to use.

> > Amount of memory? (RAM and ROM)
> 256meg RAM. 8K EPROM

128Meg will be enough - $9 in bulk apparently. EPROM?

> > Graphic and Sound?
> Geforce2

Waaaay too expensive for a $300 device, unless you were going to sell
it for a $200 loss (XBox).

> > Network capabilities? (internet capable)
> 100BT

Part of most integrated chipsets anyway.

> > Plug in capabilities (remember you're making it as cheap as possible so
> > modems, CD-Roms, HD's are all extras)
> CDRW

Not for a $300 device. Depending on the market for the device, either
a DVD drive or a CD-ROM.

> Take a look at the XBox.

$500 of hardware sold at a $200 loss. With out-of-date processors
donated for free by Intel. The chipset alone would cost $120+ (if a
GeForce 2 MX enabled chipset sells for $90 [nForce], then a GeForce3.5
enabled chipset will cost at least $30 more - more like $50 more).
Motherboard is CPU, Northbridge, Southbridge, 4 USB ports, Ethernet,
Modem, and IDE channel - very cut down to reduce costs.

I believe it should work, but ask SoundPool to make sure: info@soundpool.de
.
They don't manufacture their units any more (unless you want to buy 50
pieces...), so the possibilities are if they still have a unit in stock or
the second-hand market...

2246. CAB Trick

Newsgroup: comp.sys.atari.st
Date: 2001-07-23 18:53:04 UTC
From: peter.slegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3b5c5670.0@energise.enta.net>
Source record: 43201

Here is a clever trick that I discovered with CAB a few
days ago.

One of the annoying features of CAB is that it is impossible
to cut text from the web page.

I normally resort to viewing the source in Everest or Luna
and then cutting the piece of text that I want and reformating
it.

However, if Papyrus is used as the source code viewer then
when the Source icon is clicked a Papyrus window opens that
shows the web page much like it appears in CAB. However because
it is now being viewed in Papyrus it is possible to save it
as a PAP/RTF or to cut and paste while retaining the style.

Now if only Papyurs could be used as a web browser...

Tell you what, this MagiCPC is a bit rapid with a Pentium4 @1.7Ghz.
ANd papyrus still has prob's with the user defined colours, cant be a memory
thing now this Graphics card alone's got more than all My Atari's put
together, and a few more colours!.

Hi Peter

> Now if only Papyurs could be used as a web browser...

And since Papyrus speaks OLGA, any alterations you make are immediately reflected in the Papyrus window. As if by Mint!, that doesnt sound right does it, As if by Magic!, thats better.

"decades"? Slightly optimistic perhaps. Look back a decade. Find a
good software base. Is this still a good software base? No? I rest
my case.

> ROM is nice, but restrictive. Atari was hobbled by the difficulty of

Dodgy OS. If it was better designed, it would be able to have been
patched in software after the boot process. (see Setpatch)

I was thinking along the lines of an "awareness" week rather than
a Cyberstrider style collection and payment system.

I appreciate that many of the developers have gone but there are
also a lot still out there who probably haven't received money
from half the people who use their software.

Perhaps such an awareness week may help to find some of the
missing developers ?

It may persuade some not to leave the platform just yet.

I wonder how many people are reading this message using a
newsreader without ever sending the author a few pounds/dollars/
groats etc. ?

Regards,

Peter

The problem is it's a niche market, albeit an expanding one. They don't
even plan to break even for 5 years. I don't ever see them taking over
any desktop market, however, for low-power applications with platform
legacy requirements, you can't beat em.

> > > just to give you an idea, a crusoe TM5600 600MHz running at max power usage deliver

Oh, yea, no question about it, but then, this isn't a desktop machine
we're talking about. x86 on the desktop is king.

> At this point I would guess that a mobile p3 can render more then a crusoe using the same amount of
> power... Using less power ut performing less is not always an advantage.

Not on a desktop or server machine, but then thats not where any sane
person would dream of sticking one of these anyway. The goal is a
slightly higher platform abstraction, and slightly lower power

consumption.

Not any more than it took them to write the codemorphing abstraction for
x86, from what I hear, the x86 architecture was a real bitch with all
the registers they had to emulate, I think the reason they emulate a 486
is because those registers were documented. That was the reason NASA
gave for using the 486 as well, access to documentation. Transmeta then
had to provide a BIOS as well, as part of the morph abstraction.

A big part of the R&D has already been worked out by others already, I'm
sure AROS/UAE technology could be used. I know UAE is free under the GNU
GPL license, not sure about AROS.

Sure, but what they said was that the SIMD instructions new to the P3
would speed up DSP code, making software modems faster. I think alot of
people somehow thought that they could upgrade their dial-up connection
by upgrading their processor. ;) It's true the SIMD instructions do
include DSP specific instructions, but I doubt anyone would notice on a
dial-up software modem anyway, and I don't think the network card
drivers will benefit from SIMD at all, since there's no DSP taking place
anyway.

;) If it's meant to run Windows/Linux/Solaris ect. and sit on my desk,
give me my Athlon 1400/266 768MB DDR MSI-K7T-Master w/raid box anyday,
but this is a smaller, possibly battery-only portable hobby thing here
meant to be multi purpose webpad/PDA/portable what have you, it would
have to be very flexible in what you could do with it and where you

could bring it, so as not to become so "niche" that noone buys it.

The reason I see Crusoe as a good match for a project like this is that
it sort of combines a dozen or so pre-existing niche markets into one
market that could be sold the same hardware. There's already a market
for a low-power webpad, and people are willing to pay $2300 for them
(check out Slashdot's submissions for saturday) there's already a market
for PDA's, and Crusoe is faster than anything in most PDA's right now.
portable units for inventory and UPS/shipping are already being sold,
for anywhere between $400-$1000.

Hell, Transmeta's Crusoe, running at 633MHz, is already being used in
very-low power servers, running on 7 watts (idle) to 15 watts (max load)
http://www.transmeta.com/everywhere/products/servers/rlxtechnologies/rlxtechnologies_syste
m324.html

(this link may wrap, my newsreader sucks)

> > Plus it's upgradeable (the codemorphing), meaning the platforms it can

> What codec did Linus code nativly for the crusoe?!!?!?
> Do you have a link on what is in a Tivo box?

http://www.tivo.com/linux/index.html

They released their power-PC linux mods as per the GPL.
Since the mods were developed by TiVo themselves, they already have the
codec source, all they would need to do is recompile for Linus's
"Transmeta distrobution" (maybe not even).

If Transmeta releases a PowerPC codemorphing layer (or someone makes
one) they wont even need to do that. This would probably interest TiVo
greatly, as they already stated they wish to make their money from

selling the subscription, not the hardware.

> > The beauty is, if code isn't available, as long as you can produce the

>
> Thats the whole problem... The chip is just to slow.

yes for a desktop, but for the applications and the specs of this
project, it far exceeds what the alternatives can do, and will still be
in the "desktop speed ballpark", unlike a z80/68000 ;)

> > Windows. Windows doesn't run on the Crusoe, because the Crusoe isn't

> install it on a PC.

You mean you can install windows, install UAE, install AmigaOS, if you
were buying something specifically to do things like run AmigaOS, why
would you fudge around with windows? Heck, the best way to have a
desktop Amiga is to get an Amiga desktop anyway ;)

> The thing is windows will expect some kind of common PC chipset/bios support if

morphing?

The Sony laptop was made as an x86 laptop, this project isn't about
making a Windows98 laptop, they exist already.

> > As for the "Geek Mindshare" I think a Crusoe captures more mindshare

>
> Again, I'm not a fan of that chip because I see no use for it in all common computing form.
> PDA, laptop, bookside, desktop, workstation, server... All have better processor already there for
> the picking.

The project needs something that can do them all, at whim. No general purpose device will ever outperform a specifically desined for a purpose device, thats why we use 1400MHz Athlons to play games and 33MHz Dragonballs to sync our palms. but neither one of those would be very good at both ;)

You can play Quake on a Crusoe, and still remain at only 2 watts. The same beast will run linux, and can scale down to less and be walked around like a PDA.

It's not something that would replace the desktop, but an extension of it, replacing possibly our webpads, mp3/Rio's, PDA's, pagers, inventory interface units, ect with a common device/platform. It might even slightly eat into the laptop market as alot of people only "need" a laptop for trivial things anyway.

This is now, OEM windows in 5 packs can be gotten from Ingram Micro for
about $80, and Ingram is one of those vendors thats usually more
expensive, but they have everything.

We used to be able to sell OEM Windows with just a Mobo or HDD, but now
they require a full booting machine (or parts that could make one)

As a customer (mostly through SysSol) I'm a happy one. Never regreted
for any program taking from them. And there were times I could kill
for their GEM libs ;-)

> I think
> what many says is unfortunate with ASH is their software often requires
> MagiC or/and iConnect to run properly. (I know there are exceptions)
>
Yes, but IConnect is free with CAB, Chatter, Emailer, etc. As for
MagiC it is the author's choice to use or not use any specific OS
calls. I can't believe ASH told the fiffi author to use MagiC
threads to make the program MagiC only. Does anyone believe that
when a MiNT programmer uses fork(), does this to make his program
MiNT only?

> In
> the past it seems like ASH has not looked outside their own domains
> enough in the past,
>
Yes, for example they didn't accept credit cards ;-)(at least until
last year). So when I wanted MagiC Milan for the long expected
Milan, I told the Milan guys to order it and the result was that
the Milan arrived with MagiC-Milan in a nice envelope and lower
price than the suggested retail price :-) This doesn't seem very
'Micro$oft' behaviour to me!

> so therefore I think it is good to hear that they
> now are working on increased MiNT compatibility on GEMDOS level for
> next MagiC.
>
Personally I'd be happy to see pipes corrected (at last !) and some
more signal support. Maybe Ssystem() would also helped since this
call tends to be a stupid reason of incompatibility between MagiC
and MiNT. I've seen recently even my RTL8012 driver ported to gcc
to contain this call (checking for the MiNT version), and although
I'm saying that at least ethernet and other drivers are now binary
compatible between MiNT/MagiC-Net, no one seems to listen...

> About the TCP/IP-stack problem we have nowadays, couldn't that be
> helped if there was PPPD under MagiCNet, allowing MagiC users to get
> MiNTnet compatible connection?

>
I have pppd almost ready here (in fact this is what I'm using now)
but I think there is some problem in the ppp or compress code of
SLIP.XIF (MIF) since requests for compression are rejected by both
my ISP and window$ networks. One ISP that accepted this, was not
working after successfully logged in. Unless I have done something
stupid, this problem should be also in MiNTNet's SLIP.XIF.

I also realized that we had nothing about encryption routines/libs
for MagiC, so I had to make one (DES and now SSL). They seem to
work fine with m$-chap and the like.

Last but not least, MagiC users are not quite happy having to deal
with text configuration files (me included ;-) and I have thrown
a lot of such config files at them lately. A GEM front end would
be better, keeping the compatibility with /etc/ppp/options,
pap-secrets etc.

> It would be perfectly possible to
> initate a project to code an emulating bridge between
> MagiCnet/iConnect, to allow programs requiring iConnect to run happily
> in the future.
>
Surprise ;-), an IConnect gateway is been betatested right now. For
the moment fiffi, Emailer and some tools work fine. Bad news is that
it needs yet another text file with the user mail details (POP, SMTP
etc) since I'm NOT going to disassemble the real thing to be able to
read ICONFSET.CFG to get this info!

The programmer's docs seemed very 'sockets' to me and although there
are deviations, this thing works. And I see no reason it will not
work for MiNTNet too.

> I think we need a standard that both MiNT ppl as well as
> MagiC ppl could adhere to.
>
I think we now have a complete sockets-level compatibility. Let's now
try to solve the OSes incompatibilities (at least where possible).

> STiK programs runs happily under MagiCnet with the help of GlueSTiK for
> MagiCnet, so I say if the emulating bridge would be written, why not go
> for MagiCnet?
>
Well, why not? :-)

The funny thing is that even Adamas (1.7x demo) worked for a long
time using the Draconis gateway. I got bored and closed it, it didn't
crashed but probably I didn't visit 'difficult' sites (?)

> (This is probably something for a different thread though ;)
>
No objection ;-), I'll be back in Friday and we can discuss it in
a different thread.

> I do think it is great to see commercial software being produced for
> atari in year 2001, but I would not want to have to use a certain OS or
> TCP/IP-stack to benefit from it.
>
This is rather difficult, as long as we have more than one OS on our
platform, there will always be the danger that a program author will
overlook something, or will not care for something, or will not have
a lib or a tool or the time etc to make his software compatible with
all hardware/OSes.

From this point, up to the point of blaming software companies that
they force their programmers to do so, I think there is a huge
difference.

Errr... Probably not. It runs just fine when using GEMulator and TOS 2.06
though. I haven't compiled it yet, so I'll have to see after that.

Does anyone know of a good ST emulator that can handle the STOS mouse?
GEMulator doesn't work at all, and I've even tried the latest version.

The x86 is nasty that way... its *backward* compatible that to make something 100%
x86 compatible take a huge effort. (I also admire AMD for this... and in turn Transmeta)

>

I dont think you will see benefit at that level (packet thruput). Maybe a tiny, tiny bit by using the cache control insruction. But nothing to advertize about.
The web is vague enought that intel can be doing this compain in reference to the execution of the web data received.

If it will run on batery forget what I said.... I'm intetrested in the strongarm, possibly crusoe native?
The second part here is compiler technologie.

I use to have a PB1000, a programable 'calculator'. Nothing like a TI... it was really like a small 8bit
computer... But it died. and if I could find a <300$ replacemtn I would jump on it.

How about the StrongArm? isn't it lower power and pack a nice punch?
For those device you dont really need code morphing unless you dont have the
right compiler tools.

My original comment was about stuff outside the OS. For example software video codec.
You need those to run native to get realtime, usually assemby codec. So you need to man

power to get an mpeg2 decoder (encoder)...

>
> If Transmeta releases a PowerPC codemorphing layer (or someone makes

How about the .9 volt .5 watt Mobile pentium3?
Or the ultra low voltage mobile celeron (with mmx/sse)?

The 600mhz part is not cheap, but its still under 150$.

I think its going to be very, very hard for transmeta to take this place.
But not impossible. If they can impose themself as the standart, then they can live those 5 years to get profitable.?

> Modem, and IDE channel - very cut down to reduce costs.

The xbox cannot cost 500$ for MS to build... the lose probably include all the QA, R&D it took.
They probably spend <300$ to build the xbox... its cheap stuff when you build them in the millions.

You can find some decent complete motherboard retail single unit for <70$ (Thats with audio, 32meg video, the works)
in a retail package etc.. Those probably cost 40$ to build. (Its not geforce2 based, but a Savage4 core.)

The nForce chipset in a year might cost <50$, and people will build <100$ MB using it... Anyway, I'm planning
on building a <500$ PC using this chipset when it comes out. So I'm sure a big manufacturer can build a PC
for 300$ mass produced.

Tech TV had a segment on midi software solutions on PC/Mac hardware and dissed the Atari cutting edge solution which was not mentioned. It is common knowlege that 1990 era Atari midi solutions has revolutionized music composition and has no peers compared to the half bake attempt Apple II, Atari 4-8 bit and older 1987 Mac solutions.

Oh well, Tech TV is not perfect considering that folks who could not make the MacWorld Keynote had to sit through a somewhat flawed live broadcast with stupid commentary according to comments posted on the web. Oh well..

I've just checked parking and unparing SCSI drives with my TT and found nothing wrong. Please do the following, like I did: In HDDRCONF.CPX select a partition of this drive and then park it. Now wait until the drive has actually spinned down. Then open a window with a partition that has not yet been accessed. Does this work? The drive should spin up first, then the window contents should be displayed.

Heck, even Intel had a hell of a time with the transition from 486 to
pentium(p54c/p55c-mmx), they said there were something like 14 debugging
registers that were "left out" and caused a few problems, some quazi-ops
were dropped, and they had to abort those plans to support those
486"upgradeable" boards with the extra pins that were pentium ready.
(a small price to pay for feature-creep though)

At least the x86 legacy stuff does have an end in sight though, the
64bit CPU's won't be encumbered the way x86 was.

> I'm not sure their is a market... but if their was, AMD could also make their processor
> emulator friendly by adding so facilities to it.?

They could I suppose, but being the Athlon would do the abstraction at a
higher level, I don't know how much more effective it would be. (In a
desktop where you have watts to burn however, its a different story)

I miss the simplicity of the 8-bits, I held on to my Vic-20 for years
using it as a hardware controller for EPROM burners and whatnot. One
side of the room I burned them, and the other had UV lights to erase
them (remember those?;) My neighbors must have thought I was growing
pot.
What was so magical about our first 8bit computers that made virtually
everyone who owned them learn to program them, as opposed to today,
where people are so cynical about their machines? We used to "Love" our
computers in a way that won't happen again, it seems. Gosh, did I say
that? I sound like an old fart ;)

I'm totally in the dark when it comes to the StrongArm, I know it's made
by IBM and I hear they have a loyal following in Europe. That about sums
it up as for my knowledge there ;)

Actually I'm not sure if Tivo uses software or hardware mpeg, but
between Tivo and Transmeta, I'm sure they could whip something up.

Or even a retrofitted Sony laptop motherboard maybe (gawd I hate laptop
hardware though ;) microATX would be good, with video/sound onboard,
maybe using laptop IDE hard disks, External 'wallwort' powersupply,
internal battery.

I'm not sure how much power the P3 system as a whole uses yet, havent
had a chance to play with one yet, I'll have to look.

> those 5 years to get profitable.?

They've got one thing going for them, noone else is after this market, it's currently dominated by hundreds of 'submarket' solutions, Palm, Rio, etc, and Transmeta doesn't even necessarily need to compete with them to controll this market, they just need to become the main vendor for the tribes currently camping there.

Then again, Intel might just decide to squash them.

I agree there are things that does make some sense to use, even though
OS specific, although the current OS situation on TOS platform is a bit
splintered. Is there any hope of seeing threads in MiNT, to reach MagiC
compatibility? Why not meet half way? :))

> I'm saying that at least ethernet and other drivers are now binary
> compatible between MiNT/MagiC-Net, no one seems to listen...

I find that strange. Magicnet could well be a step towards a unified
TCP/IP-stack on the atari, especially if the bridge between existing
stacks are in the works. Awesome.

> > About the TCP/IP-stack problem we have nowadays, couldn't that be

Well I think if the hard work has been done, the effort to make a front
end would be much easier.

> Surprise ;-), an IConnect gateway is been betatested right now. For

> >
> I think we now have a complete sockets-level compatibility. Let's now
> try to solve the OSes incompatibilities (at least where possible).

I agree with you, and hope others will see it the same way. Since we have 2 major flavours of GEM/TOS on the atari (MiNT+AES/MagiC) I think we should make them as compatible as possible. Our platform is a bit too small to have a battle about what OS to support and which not to.

> > STiK programs runs happily under MagiCnet with the help of GlueSTiK
> > for MagiCnet, so I say if the emulating bridge would be written,
> > why not go for MagiCnet?
> >
> Well, why not? :-)

Hehe :) MiNTnet/MagiCnet would make sense as "standard" these days, since it offers a free TCP/IP stack, that (possibly) soon also will have support for the other existing stacks.

Regards,

Joakim

No the server isn't down. It's still working but people, including me,
can't get in. Why? I wished I knew. We are trying to contact the people
involved but so far no luck. I hope the connection will be restored
soon.

I guess meeting half way is not really possible. If threads were ever
added to MiNT I would expect them to be POSIX threads, in order to be
compatible with Unix. MagiC threads are no POSIX threads and I doubt
that they are compliant to any general standard.

> > I'm saying that at least ethernet and other drivers are now binary

BTW, the MiNT ethernet driver for the Riebel card does not work with
MagiC/MagiCNet, at least not on my TT. It crashes.

I ported the GNU pth library a while ago. It provides POSIX threads for
MiNT. Version 1.4.0 is available at Sparemint.

>still demand for it?

Not for the moment.

>Blaming ASH for this situation is nonsense, they are the
>firm that distributes the software, it's the author who decides what happens to
>his software.

Ever heard about contracts? I can imagine that firms says, oke I'll do
the contribution for you but we must have the exlusively rights for it.
I'm not a lawyer, so maybe the next is just plain bullshit. If authors
have signed such a contract have they then the rights to release their
stuff as freeware or whatever later on without the permission of the
distributor? I guess not.

>You've attended several of the German Atari shows, do you remember what firm
>attracted the biggest crowd?

Sure. Ordered by the longest queue first, R.O.M., Invers Media, Uwe
Seimet, ASH...

>I never had the impression that crowd was forced by
>anyone. At some shows I had to stand for well over 40 minutes in line to update
>some of the ASH software. Nobody there was forced to update or buy anything....

Hmm, I don't know why it took so long for you but I always had my
updates withing 5 minutes.
You take the whole thing out of contest. I'm saying that by making
products MagiC-only they force people to buy other things. I'm not
saying that at shows they pointed a gun at your head and forced you to
buy their stuff. The times I dealed with the ASH people they were always
very nice indeed. At the shows there were vendors who weren't so nice
expecially after they were being verbally attacked (for good reasons)
by some visitors. :-))

>way the programmer intended it to run, then don't use it...

I don't use it anyway. I was just curious why such a very basic
application needs w_dialog. As said before I do understand why some
application relies on w_dialog to fulfill certain tasks but I can't
understand why applications refuse to start up without w_dialog. Cab and
Papillon make use of w_dialog for some tasks but yet I can use then both
without w_dialog. Sure there are restriction but I can live with that.

>the trashcan. What on earth has ASH got to do with w_dialog? I can't see the

Nothing as explained in a previous posting.

>BTW what is so dreadfull about w_dialog? a lot of people here seem to have a
>problem with it... it's simply a system extension, you throw it in the AUTO
>folder and forget all about it... :-)

It's a system extension which holds AFAIK some bugs which probably comes
more into the foreground if one use a non-MagiC system.

Ofcourse. Let me say that my ROTFL was rather misplaced. It's wasn't the
fault of you reader but of you.

>It seems to be incapable to set the time zone properly... since a couple of
>months *all* your postings are two hours in front of GMT summertime...

Are you really sure of that? I wouldn't count on it. In the region we are
living we are for the moment two hours ahead GMT, so if I use as timezone
MET DST +0200 it's oke. Right?
Take a look at this.

Date: Tue, 24 Jul 2001 09:31:24 GMT
NNTP-Posting-Host: 213.224.143.82
X-Complaints-To: abuse@pandora.be
X-Trace: afrodite.telenet-ops.be 995967084 213.224.143.82 (Tue, 24 Jul 2001 11:31:24 MET
DST)
NNTP-Posting-Date: Tue, 24 Jul 2001 11:31:24 MET DST

This is an extract of a posting I wrote earlier on today. What does
it says? It says that I wrote the message at 11:31:24 local time. The
newsserver I use translated the 'Date' into GMT 09:31:24.
Every decent newsreader relies on GMT to sort the postings by date. So tell
me where have I make a fault?
Okami and a few Mac newsreaders I have tested haven't a problem with my
postings at all. Maybe a setup fault on your side?

Hiya

Yep it's called track-it, but first the good news:)))

I do have this program somewhere... Now the bad news:(

it dont work on STE's and iirc TOS 1.4:(((

I did start work to make a compatible/STE version, but i think i lost my
source when i swapped hard drives and thought i'd backed my source
folder up:(((((

So you say that I was lying when I said ASH and the other companies that distributed my software did not force me to do anything? Note that I am one of those programmers you are talking about, i. e. a programmer that has ASH distribute his software. You were talking about me and claimed I was forced. I say it again: Nobody forced me and you are lying if you tell the opposite.
Do go ahead and ask the programmers you are talking about. Why don't you do this?
I think I know why: You are afraid that they will say that what you do not want to hear.

It's a worldwide conspiracy to intentionally ignore every accomplishment
Atari ever made. They don't want to admit that a game company had so many
innovations first. They know about it, they just don't mention it on
purpose.

To clarify this. You say that ASH forced all of their programmers
except me not to distribute their code etc.? Except me, because it is
bad luck for you that I am the only one of these programmers left as far
as reading this group is concerned. This is really a problem now for
you, because you cannot hide behind telling us you are not able to
contact the programmers. You are just afraid they would contradict you
like I do.

> First of all I don't have their addresses and secondly they
> probably won't bother to reply.

Are you going to tell me you cannot get e-mail addresses of people who
have posted regularly in the Internet, even if this was some months ago?
You do not really want an answer from them, that's it.
Why do you think they would not reply if they were still interested in
the Atari market and would like to release their software not via ASH
but otherwise?
But I agree that several of them would not answer for a simple reason:
They are not interested at all in the Atari market and have quit the
scene years ago. I know most of those who had ASH distribute their
software in person. Some of them do not even have their Atari anymore
but got rid of it years ago. They also do not run any emulation, but
nothing that has to do with the Atari at all. How can you think they are
interested in releasing or supporting software for the Atari when it is
more than obvious that they are not interested?

No doubt Thomas will be along to confirm this, but the latest
Thing1.27beta has limited support for filenames with more than 32
characters, though not as many as jinnee (64 chars) as yet.

Actualy threads works in MiNT, we have demo application on our pages, it
may be that threads are kinda diferently implemented?

Well some ppl simply deny all with "MiNT" in title.. Same way why that
big arguing started.. I still think MiNT net is most complete stack, with
all those bridges basicaly ALL other can run as well.. So in MiNT or Magic
with MagicNet u can run basicaly all major used apps.

>
> Well I think if the hard work has been done, the effort to make a front
> end would be much easier.

Um i will disagree here though :) TXT cnf and their hardness etc is a
Myth.. :) for example:

snip----------

```
# FASTLOAD = YES forces fast loading (without zeroing the memory)
# for all programs. This defines default state , that can be modified
# later via apropriate kernel calls (use MiNTsetter utility to toggle
# later without rebooting)
# FASTLOAD = NO means that information from program header will be used
# to decide (this is what TOS does)

FASTLOAD = YES
```

snip----------

I dont see how this is any harder as checking boxes in GEM, often with
less description.. Most UNIX (esp recent stuff) CFG is VERY well
docmented.

>

According to Patrice Mandin the MiNT thread implementation is based on
POSIX threads, which is a good decision because POSIX threads are a
platform-independent standard. MagiC threads do not comply with that
standard. guess there is no way to get them MiNT compatible or
vice-versa.
Now please don't anybody start again with telling I'm too negative when
expressing my doubts. It's just that threads are a quite complicated
issue in general.

You can also load it into Look'n See and it will display the text in it, stripped of the tags etc. I have installed L'nS as a viewing application for most files so can double-click an 8+3 HTM and get the text in a window, from which blocks can be cut to the clipboard - or even the whole page written to disk by selecting this in the Print dialog. Unfortunately V 0.95, at least, will not do this with LFNs, but most still can be loaded into it if you start it manually first. On a few occasions this fails (?with *very* long names?) but you can always rename them, or copy them to a partition that doesn't have LFN's enabled.

>English hyp file of version 2.5 the passage is still present though...

Yep - you are right - I've found it in both the 2.5 HYP and manual,
which say:
Both STiK and MintNet only support the SLIP protocol. At the
time of writing, the CAB.OVL files for MintNet and STiK are
both shareware programs. They are not supplied with CAB but are
feeely available from online services and public domain
libraries.
Presumably the SLIP bit was so when originally written but is no
longer true. Are these OVLs now freeware? There is nothing about
this in the German 2.7 HYP - in fact the OVLs aren't even
mentioned AFAICS... (and the index is useless!)

Umm... you're using the wrong end of the telescope.

A decade ago there were several choices of competing Operating
Systems.

Now for all intents and purposes there is only one.

(MacOS is a far distant second.)

With the kind of momentum behind the current OS, it's unlikely that
any other OS will be able to overtake the existing software base for a
long, long time, if ever.

Go to the local CompUSA and check out how much shelf space is devoted
to native Linux apps.

I rest my case.

BobR

>that? I sound like an old fart ;)
>

The simple answer is that there was nothing else available and very
little was available for what WAS available.

There was nothing that would run a competent word processor or
spreadsheet, or play a photorealistic game, or render in 16 million
colors, or typeset a page layout, or sort and relate a million entry
database.

If you wanted something other than what you could buy from the back of
Compute's Gazette, you had to learn to program and write it yourself.

There weren't stores like CompUSA where you could just buy the program
and get on with whatever it was you wanted to do.

You HAD to figure out how to POKE graphics to the screen, or VARPRT to
find out where your string variables were stored.

When I bought my first computer (an even older fart), an OSI C1P, I
wanted to play games on it. I bought game programs and ended up
HAVING to learn to program to fix the bugs in the "commercial"
programs. I had to learn the "guts" of the computer to figure out
how to add sound to the games since the manufacturer had designed
sound into the system but not implemented it.

Sure it was fun, and sure I learned a lot, and actually made some
money with it, and yes indeed, I wouldn't have missed it for anything.

But it wasn't what I'd originally wanted to DO with "a computer".

Now, you don't need a soldering iron or disassembler to do what you
want a computer to DO. In most cases, you just get the software and
DO it.

Not everyone wanted to "tinker" with a computer. Computers didn't really "take off" until they became capable enough that you DIDN'T have to tinker with them to get them to do something.

That doesn't help the "tinkerers" very much, I know, but that's the main reason things are different today than they were when 8-bit computers were the only thing available.

That's actually what the original intent of this huge message thread was, to provide a "new" version of the machines we used to tinker with.

IIRC it only worked with TOS 1.00 although I've a patched version that
works on TOS 1.62 in mono only since I never needed a medium or low res
version.

>I did start work to make a compatible/STE version, but i think i lost my

Hi Lyndon.

There is or was a scantips doc on the Homa site, whose URL I haven't got.
It also mentions a scanning FAQ, but I cannot guarantee the URL:

Quote:

Just a quick note on the scanning FAQ: It has now been updated by Jeff
Bone to be in HTML format. This allows you to see sample scanned
images in the text, and have a hyperlinked interface. To reach the
new version of the faq, please use the URL of:
<http://www.dopig.uab.edu/dopipages/FAQ/The_Scan_FAQ.html>
Unquote.

Charles.

Hi,
You could also ask around for a JAM-8 (balanced tele jacks) or FAD-8 (unbalanced RCA jacks, like on the FA-8) unit from the swedish company Line Audio Design (www.lineaudio.se).
They're discontinued (maybe there are a few left in Line Audio's stock - you better ask), but there could be such units around on the second-hand market too - and they sound slightly better than SoundPool's units due to a newer design and other components...

Best regards,
Claes

>NNTP-Posting-Date: Tue, 24 Jul 2001 11:31:24 MET DST
>
>This is an extract of a posting I wrote earlier on today. What does
>it says? It says that I wrote the message at 11:31:24 local time. The
>newsserver I use translated the 'Date' into GMT 09:31:24.
>Every decent newsreader relies on GMT to sort the postings by date. So tell
>me where have I make a fault?

Sorry Martin, but it's just the opposite. "Date" is set by your newsreader,
NNTP-Posting-Date is set by your provider at the time you post the posting,
this however has no influence at all, it's only there for informational
purposes. Some providers don't even add the NNTP-Posting-Date...
A newsreader follows the time set in "Date", which is logical, at the time
I'm writing this it's 00:20 GMT +2, but I'll probably post this posting
tomorrowmorning. Take a look at the header, it'll show you when I replied to
the posting but *not* when I posted it...

The newsserver doesn't translate anything conecerning time and date, every
newsreader relies on the GMT, and since the "Date line" is incorrect, every
newsreader will translate/interprete it faulty...

In your example the date is set to 09:31:24 GMT, that's the time you wrote
it, the NNTP-Posting-Date is exactly 2 hours later. The NNTP-Posting-Date is
fine, but the "Date" is incorrect.... it should be:" Date: 09:31:24 +2"...
In case you're not convinced yet, take a look at the X-trace line, that's
added by your povider also, and shows the correct time as well. Also take a
look at postings from other people here, you'll notice that your's the only
one which don't carry a "-" or "+" after the time in the "Date" line.

>Okami and a few Mac newsreaders I have tested haven't a problem with my
>postings at all. Maybe a setup fault on your side?

No way... :-)
But I admit it's weird.... the personal mail you sent me today showed the

correct timezone. Do you perhaps have to set time zones seperately in Okami
for mail and newsgroups?

Cheers from Belgium
Dennis

Hi Martin,

>Ever heard about contracts? I can imagine that firms says, oke I'll do
>the contribution for you but we must have the exlusively rights for it.
>I'm not a lawyer, so maybe the next is just plain bullshit. If authors
>have signed such a contract have they then the rights to release their
>stuff as freeware or whatever later on without the permission of the
>distributor? I guess not.

I don't have a clue... but for the sake of argueing let's assume you're
right. Let's assume that the developer of CAB signed such a contract, it
would give ASH the exclusive rights to distribute the software,but this
however is not the same as giving them the rights to the program. You're
assuming that the programmer(s) give up their legal rights to the program.
I can imagine situations in which the programmer sells his program to ASH,
but then ASH holds the copyright... they've paid for it. I think it's safe
to say that once a program doesn't sell anymore, and is removed from their
productlist ASH would not be hurt in any way if the programmer would
eventually decide to release it as freeware. Since CAB is still on their
productlist and copies are actually still sold of it, it would be a breach
of contract and a conflict of interests if the author would decide to
release it as freeware today....

Another point to consider is that CAB as we know it, is not the work of one
man, Sven Kopacz and Jï¿½rgen Koneckzny to name just these two have put a lot
of work into CAB as well. So if CAB was to be released as freeware and the
sources made available to the public, these programmers would need to give
their blessings also.

>Also I said it's my believe. This doesn't mean that I'm right. It's up
>to you and others to convince me from the opposite. Uwe Seimet couldn't
>convinced me at all.

Well, I'm not affiliated with ASH and have no knowledge of how they close
their deals with the authors... but how's this?
Normally there should have been English versions of ASH Emailer 2.3f and
Texel 2.3 for sale. The only reason why they aren't is because the authors
are not interested.... ASH has pleaded and tried about every trick in the
book to get them to compile an English version... if the exlusive rights to
these programs would belong to ASH instead of the authors then we wouldn't
be still waiting...

Uwe Seimet already stated that ASH only distribute HDDriver, they don't want
the exclusive rights to distribute it and neither do they demand the rights
to distribute his other work (i.e Diskus).
ASH also distributes Papyrus and NVDI, it seems to me that this is under the
same arrangement as with Uwe Seimet.... so that already makes three...

Ifusion is sold by ASH but also by Mucs. Armin Diedering sells Icon Master,
which is not on the product list of ASH... Jï¿½rgen Koneckzny sells Teli,
which is shareware..., iCab which resembles CAB very closely is not sold by
ASH either.... the point is that if ASH would realy have exclusive rights
then they could demand to be the sole distributor of these apps also.

>At the shows there were vendors who weren't so nice expecially after they
>were being verbally attacked (for good reasons) by some visitors. :-))

<grin> Anyone you know? :-))))

>>BTW what is so dreadfull about w_dialog? a lot of people here seem to have

>>AUTO folder and forget all about it... :-)
>
>It's a system extension which holds AFAIK some bugs which probably comes
>more into the foreground if one use a non-MagiC system.

Possibly, but it seems to me that people here overlook that w_dialog is a
system extension for *TOS*, the authors never claimed it would run as it's
intented to, under MiNT.

Hi Uwe,

>According to Patrice Mandin the MiNT thread implementation is based on
>POSIX threads, which is a good decision because POSIX threads are a
>platform-independent standard. MagiC threads do not comply with that
>standard. guess there is no way to get them MiNT compatible or
>vice-versa.

According to Andreas Kromke in the MagiC 6.xx programmers docs the threads
used by MagiC are compatible with these used in Sun Solaris 2.x.
MiNT now having threads is a good thing ofcourse, but if the developers
would have opted to go for the Sun Solaris 2.x standard then at least both
the OS's would have shared the same standard.
The MiNT developers undoubtedly will have had a good reason to opt for the
POSIX standard, but like usual they ignored what was already succesfully
implemented in MagiC, making it even more difficult "to bridge the gap".

Browsing through the programmers guide of MagiC 6.0 I was surprised to see
how Andreas went through great lenghts to make MagiC and MiNT at least a
little compatible. I can't help thinking if the MiNT developers would make
the same effort the OS's would both be much more compatible.

Cheers from Belgium

As a little off-topic sidenote, maybe it may help someone to know that there is a utility which enables recognition of ANSI escape sequences. It's called ANSI-ST and as far as I could see, works more-less OK (in colour, too) It's nothing sophisticated, no windowed output, etc; it just replaces the full-screen VT52 output with full-screen VT-100 (or something like that).

> if anyone has a used one for sale first.

I only could offer a Soundpool 'Falcon Analog 4' which I have only
taken out of the package once and saw that I can't use it.
Reason was that I have a 'JAM IN' and a 'JAM clock' from Line Audio.
While the 'JAM IN' has a through port and therefore could be used
together with the 'Analog 4' the 'JAM clock' has no through port and
therefore has to be the last device in the chain. This would be no
problem since the 'Analog 4' also has a through port but the 'Analog 4'
like all Soundpool devices (as Mr. Baumgï¿½rtner told me) has different
connectors that are cheaper but have fewer pins (so some lines have
to be missing). So if I use the 'Analog 4' I can't use the clock and
therefore don't have the 44.1 kHz I need.
BTW, if you buy the 'Analog 8' don't forget to mention that you need
the special cable. It comes at no extra cost but only if you tell
them to include it.

> same arrangement as with Uwe Seimet.... so that already makes three...

With KOBOLD it's the same. ASH has no exclusive rights for selling
KOBOLD, but the author has left the Atari market quite some time ago and
is not interested in selling KOBOLD on his own anymore. If ASH would not
sell it anymore, nobody would. This is also correct for NVDI and CAB. If
one day ASH stops being active in the Atari market all these (and other)
programs will not be sold anymore and there will not be any support. Not
because ASH owns any rights and blocks the authors from doing what they
want with their software but simply because the authors have lost their
interest in the Atari market a long time ago. Probably not only in
writing software for the Atari but also in writing software in their
spare time for other platforms as well. Most of them started writing
software as students and some of them have a family now. It's easy to
understand that they are more interested in their wife and children than
in the Atari.

I played with it a while back. But I can't remember if it can read PC hard drives.

The problem with emulators like Winston (and I assume STeem Engine too) is that they only read disk images and are only good for playing disk games.

I'll give PacifiST another try, but I'm not too hopeful.

Nope. PacifiST doesn't handle the STOS mouse either.

2317. Problems with a rouge email

Newsgroup: comp.sys.atari.st
Date: 2001-07-25 15:56:28 UTC
From: JOHN NICHOLAS OAKES <doyene@zetnet.co.uk>
Message-ID: <WS3.9e2d3b89.7e1c65e0.doyene@zetnet.co.uk>
Source record: 43188

Hei all.
Is it possible for a email to wipe out my partition or receive bogus downloads on draconis. Because yesterday that what happened. I noticed while I was downloading a website to later view.
I received a Blank recurring file without any chance of removing it (TOS 33). Then I got another load
of duff files. I checked with my WenSuite to see if there was a similar problem, none as was there.
So I look through Linux my Midnight Commander, to see what they were. To my amazement it was having
trouble reading them aswell. but I manage to remove them. So thinking the problem solved I returned
to retreive some emails via Marathon, which worked fine and okay in reading. But when I came to closing
folder, the whole setup went kaput leaving me looking at a odd file. Is it possible there is a chink
in Draconis armour, because it stems in that area only. Please take out your pipes and discuss.

regards

John Nicholas Oakes.

>
>Sorry Martin, but it's just the opposite. "Date" is set by your newsreader,
>NNTP-Posting-Date is set by your provider at the time you post the posting,

It's my time to say sorry Dennis, you're wrong.
When I write a message and prepared it to send the header will say
this: Date: Wed, 25 Jul 2001 16:30:56 +0200 (MET DST)

I actually wrote this message at 16:30 Belgium time. Now when I send it
immediately the Pandora newsserver will translate it into this:

Date: Wed, 25 Jul 2001 14:30:56 GMT
Why the Pandora Newsserver do this I don't know. I suppose they follow
the rules.

>this however has no influence at all, it's only there for informational
>purposes. Some providers don't even add the NNTP-Posting-Date...
>A newsreader follows the time set in "Date", which is logical, at the time
>I'm writing this it's 00:20 GMT +2, but I'll probably post this posting
>tomorrowmorning. Take a look at the header, it'll show you when I replied to
>the posting but *not* when I posted it...

Correct.

>The newsserver doesn't translate anything concerning time and date, every
>newsreader relies on the GMT, and since the "Date line" is incorrect, every
>newsreader will translate/interprete it faulty...

And yet the Pandora Newsserver does it. But as the newsserver translated
the date correctly into GMT the newsreader should interpret the time correct.
To prove it's the newsserver take a look at this.

NNTP-Posting-Date: Tue, 24 Jul 2001 18:52:06 MET DST

==========unquote==========

As you see I wrote this message with a Mac client. Just like with Okami
the date is in GMT.

Another prove: Okami can make logs of every move one do. Below you'll find
an extract of the export log. Exporting doesn't mean I send the message
out. It just make the posting ready to send.

==========quote==========

24 Jul 2001 11:30: Started `oexport'
24 Jul 2001 11:30: News for comp.sys.atari.st: Re: chapelie.rma.ac.be
24 Jul 2001 11:30: 1 sent, 0 susp, 0 skip, 0 canc, 0 err
24 Jul 2001 11:30: exit code 0
24 Jul 2001 11:30: Terminated.

==========unquote==========

On thing bothers me though. Since I use the Pandora newsserver the Date
and NNTP-Posting-Date us always the same. I know for sure that I write
sometimes messages and wait then for hours before I send then out and yet
both are the same. Can it be that the Pandora newsserver change the Date
to follow the NNTP-posting-Date? If they do this is this according the
rules?
That might explain why there is a different between the date I exported the
mail and the date found in the header.

>In your example the date is set to 09:31:24 GMT, that's the time you wrote
>it, the NNTP-Posting-Date is exactly 2 hours later.

No Dennis you're completely wrong here. I really sended that message at
11:31:24 +2. I couldn't sended that message at 09:31 because I was still
in bed at that time. Shame on me:-))

Part of the ppp logfile
Jul 23 16:54:12 hades060 syslogd: exiting on signal 15
Jul 24 10:55:50 hades060 syslogd: restart

It says I've switch off the Hades on Monday 23 at 16:54
On thuesday I started the Hades up at 10:55

>The NNTP-Posting-Date is
>fine, but the "Date" is incorrect.... it should be:" Date: 09:31:24 +2"...
>In case you're not convinced yet, take a look at the X-trace line, that's
>added by your povider also, and shows the correct time as well. Also take a
>look at postings from other people here, you'll notice that your's the only
>one which don't carry a "-" or "+" after the time in the "Date" line.

Again Dennis I really wrote that message at 11:31. In fact a little bit
earlier as the Date stamp is added when I start writing the mail.

I don't know if the timestamp has to carry a '-' or '+' when the zone is
GMT. Can someone clear this out?

>
>>Okami and a few Mac newsreaders I have tested haven't a problem with my

>for mail and newsgroups?

Really believe me. It's the Pandora newsserver which translated the time.
I think it's time I post a message to pandora.help.

It's the second time now I write this message. This on at 18:59 local
time. I will export and send it at ~19:06

I started the previous reply at 17:34:20.
I exported that mail at:

25 Jul 2001 18:55: Started `oexport'
25 Jul 2001 18:55: News for comp.sys.atari.st: Re: Correct timezones? (Was) Atari Browser
poll

Hi Derryck,

Papyrus 7.5 works very well as a source code viewer, allowing
elementary Wizard editing and very simple cut and pasting. Thanks for
the tip (whoever it was) You don't even have to worry about the
German!!

Jean-Franï¿½ois Lemaire wrote:
>
> Could someone explain in layman's words what are threads and what they
> are good for ? My ignorance makes me miss the whole issue.
>

The only thing a central processing unit (CPU or processor) can do is executing instructions. The cpu will execute instructions in a certain order. What the order actually might be is irrelevant, as long as it is well defined and always the same when started at the same instruction in the same circumstances

A thread is this starting instruction and all the instructions that the cpu will execute consequently. Dead simple.

Complications arise when the cpu is interrupted.

Interrupts arise when a thread issues a system call or causes a contingency or a peripheral needs attention. A transfer might be completed.

The cpu will remain executing instructions after the interrupt, but now at a differnt point. These points are defined by the cpu itself, they are part of its design. Every kind of interrupt has its own starting point, the point where its starting instruction resides. Hey where did we read about starting instructions?
Yes, a interrupt starts a new thread!

This is the lowest level of threading. But it is also the basis of multitasking. The mere fact that a cpu must be able to be interrupted makes multitasking possible.

Of course an interrupt does not mean that the interrupted thread has ended. To be able to continue the thread, after the interrupt is serviced, the cpu somewhere stores the point at which the thread is interrupted.

The thread that handles the interrupt will use this stored point to restart the interrupted thread end doing so end itself.

All the threads that handle the interrupts are most often assembled into a program that can carry many names. 'monitor', 'executive' or 'kernel', to name a few.

Multitasking is basically a feature of the kernel. The kernel starts all the application threads (or programs). To be able to do so kernels generally keep a table of application threads in which it remembers the stored points of each application thread that is interrupted. (among other data :-)

Most applications are only a single thread.

An application can split itself into 2 threads by a system call (defined by the OS of which the kernel is the kernel). Each thread can split itself again.

Multithreading within a applcation is needed when the applications has to wait
for events at different points independant of each other.
For example: have 2 or more dialogues on the screen using
handlers that must not exclude each other. In short, the application wants to
wait at different points at the same time. This can only be done in separate
threads, because each thread can be iterrupted and restarted independantly.

I know nothing about POSIX, or MAGIC or MINTs implementation of threading.
My description is very general. It describes what already existed long before the
3 above.

Lol ;) We had this same war almost exactly 1 year ago! It's similar to
Goddards Law! (Godwin?) First, someone will point out the origins of
specific technological advances, then we'll rebut with 'but he was
/born/ in country /y/ so /x/ doesn't get the credit!'

Then someone will say Americans are all fat and eat at McDonalds, then
someone will rebut with Europeans have teeth that look like dice.

You know it's going to happen, the bloods in the water, the sharks will
come. :)

Hi Uwe,

>It's easy to understand that they are more interested in their wife and
>children than in the Atari.

There are more women and children then Atari computers on this planet.
Meaning it should be more difficult to find an Atari then a woman, so
shouldn't one treasure his Atari more especially since the latter isn't
produced anymore?
The production of children ... :-)

Cheers from Belgium
Dennis

Sigh... the software base for the existing Operating System is the
point.

The point is that the Operating System a decade from now will likely
be the same, or a derivation of the current Operating System, so the
software base a decade from now will likely be the same software base
as it is now, with incremental changes, not radical shifts in support
for "other" Operating Systems.

So much for Chunks assertion that the upgrade to the Hades would be
available by early fall/2000. He was screaming and jumping that the
upgrade would be available on this side of the Atlantic in mpls. You
have some EXPLAINING to do. Whats the difficulty in releasing new
dated hardware? Sounds like the Tramiel syndrome has infected Europe.

sinclap!
somewere in mpls

Hi all (and especially David Bolt and Kevin Dermott!)

Just writing this at tonight's Cheshunt Computer Club meeting. Remember this thread last month when I was telling you about a member having a problem with HD floppies not working under MagiC, but they were ok under TOS?

Well thanks to David and Kevin who sent me programs to solve this problem, I can report that they have solved the problem and Danny sends his thanks.

Cheers!

James

What does the anything in the above post about the CT60 and Riored have to do with the Hades? Don't you know that the CT60 is a Falcon upgrade, and the Riored is a PPC project, both completely independant of the Hades and both haven't been promised for any date (that I'm aware of)?

> He was screaming and jumping that the
> upgrade would be available on this side of the Atlantic in mpls.

How do you "scream and jump" on usenet? Ok, screaming can be done by using all CAPS, but I doubt that was the case... Maybe your Mac is malfunctioning. ;)

> You have some EXPLAINING to do.

Who has some explaining to do to whom regarding this post?

> Whats the difficulty in releasing new
> dated hardware?

What's the difficulty in having some respect and not insulting people for
something you apparently know nothing about (i.e. the CT60 and Riored)?

> Sounds like the Tramiel syndrome has infected Europe.

Sounds like the Sinclap syndrome has infected "mpls". :)

Oy! Sinclap, you don't know what crap you're speaking again. The CT60 is
nothing to do with the Hades - it's an accelerator for the Falcon.

Why don't you piss off back to the .advocacy group where you belong and
leave this group free from your spouting crap?

more proof that "Chunks" is TiFKAS' imaginary friend who appears only
when he's losing an argument. Nobody named "Chunks" made that claim.

> He was screaming and jumping that the
> upgrade would be available on this side of the Atlantic in mpls.

oh, and how about TiFKAS' screaming and jumping that Steve Jobs would
"destroy Apple if he ever came back"? How about TiFKAS' screaming and
jumping that the Cube would be a huge success? How about TiFKAS'
screaming and jumping that Pointcast would totally destroy Atari
presence on the USEnet (guess what got destroyed instead?). Pot.
Kettle. Black.

More strained spinach, Cartman?

> You have some EXPLAINING to do.

the only explaining needed to be done is any proof that TiFKAS is
employed by anyone as an "Apple Power Rep". Name of business. Name of
manager. Phone number where said manager can be contacted to confirm.
And BTW, TiFKAS, according to real Apple Power Reps, you are not
prevented from giving this info by an NDA - in fact, the real reason you
won't give this info out is that if you were really employed by someone
to sell Apples, and they found out about your long-time USEnet
harassment campaign against other computer users, that you would face
instant dismissal.

in article <3b5f0a841fd8680@pandora.be> (comp.sys.atari.st)
Martin "Nightowl" Byttebier wrote on Wed 25-07-2001 17:07 (GMT):

> Really believe me. It's the Pandora newsserver which translated the time.

Just to tell you that my server do exactly the same thing. The reason
they give is that some people deliberately use a wrong date (usually in
the future) to make their messages appear "on top of list" with "some"
newsreaders. With the date automatically set to the posting one, this is
then avoided and the date is always a valid one. It's ok with the RFC
afaik. GMT or time zone is not a problem.

Bye,
/Pascal/

Date: Wed, 25 Jul 2001 17:07:02 GMT

Hi Martin

>>In your example the date is set to 09:31:24 GMT, that's the time you wrote
>>it, the NNTP-Posting-Date is exactly 2 hours later.
>
>No Dennis you're completely wrong here. I really sended that message at
>11:31:24 +2. I couldn't sended that message at 09:31 because I was still
>in bed at that time. Shame on me:-))

I believe you Martin, but it depends on how you view it....
11:31 MET is equal to 09:31 GMT, since there is no +2 behind the MET time,
one could assume that is really was 9:31.

>On thing bothers me though. Since I use the Pandora newsserver the Date
>and NNTP-Posting-Date us always the same. I know for sure that I write
>sometimes messages and wait then for hours before I send then out and yet
>both are the same. Can it be that the Pandora newsserver change the Date
>to follow the NNTP-posting-Date? If they do this is this according the
>rules?

The Pandora newserver changes the Date line, there's no other explanation
for it. Why they feel the need to change it and on top of that mess it up
by setting an incorrect timezone is beyond me :-/
It's most certainly against the rules, they should leave the Date line well
alone since this is created by your newsreader, and since they don't add
the +2, the new Date line doesn't follow the NNT-posting-Date but lags 2
hours behind...

>I don't know if the timestamp has to carry a '-' or '+' when the zone is
>GMT. Can someone clear this out?

Ofcourse, because otherwise our newsreaders can not sort out the postings
correctly. Just suppose we would both post to CSAST, I post at 11:00 and
you reply at 12:00 local time....
My posting will carry the 11:00 +2 tag, and yours the 12:00 GMT tag, every
newsreader will sort your posting before mine, because it assumes it was
posted an hour earlier, while in fact it was an hour later... so someone at
Pandora is goofing up, and need his hands slapped!! ;-)

>Really believe me. It's the Pandora newsserver which translated the time.
>I think it's time I post a message to pandora.help.

I do, as a matter of fact I know it's the Pandora newsserver. I know you
have strong feelings about correct timezones, so it is very unlikely that

you would have overlooked to set them up correctly.... :-)

This ofcourse applies to you...
Unfortunately there are a lot of people here who haven't set their timezone correctly, or simply haven't bothered to do so. Our American friends seem to have the biggest problem with this. Going through the headers of several postings there is one consistency : *all* the postings posted with Newsie carry the wrong timezone tag...
It's quite a comlicated issue, one gets things thrown around his ears like CDT, EDT, CEST, PDT, UTC, GMT, MET, DST....etc. Some newsreaders depend on a cookie to determine the correct timezone, others search for a line in the config file... but it always comes down to the user having to take care to set it correctly. If I would set the timezone CPX for ASH Emailer to +5 one could assume I live in Karachi... :-)

Cheers from Belgium
Dennis

Don't put a disk image in drive A: - that's it.

What version of WinSTon are you using? The GUI quite clearly shows you
what folder on your harddrive that will be mounted as C: on the atari
(and allows you to mount more than just C: also)

By default it does mount an empty folder.

Date: Thu, 26 Jul 2001 22:49:26 GMT

Hi Pascal,

>GMT or time zone is not a problem.

Sorry but I disagree...
French and Belgian ISP's should stick to their local timezone when they feel the need to change the Dateline of a posting...
They create an artificial time gap of two hours, which like I explained yesterday can upset the sorting of the newsreader, what's the use of an option "sort by Date" if it's incorrect... in fact it doesn't matter how you sort the postings they will always be sorted incorrectly. This problem can be avoided by the ISP by simply adding +2 behind GMT, GMT doesn't even need to be added to the line since all time zones are calculated in conjuction to/from GMT time... simply adding +0200 is enough.

Looking at headers from various postings here, I think that changing the Dateline is common practice among ISP's, but we don't really notice it since they replace the line with a correct matching time zone tag...

>The reason they give is that some people deliberately use a wrong date
>(usually in the future) to make their messages appear "on top of list"
>with "some" newsreaders. With the date automatically set to the posting
>one, this is then avoided and the date is always a valid one. It's ok
>with the RFC afaik.

RFC rules don't apply to ISP's... well not in this particular case. One could ask himself if it's ethically OK to change someones posting, since that's what happening here. The reason they give for changing the date is quite acceptable but it should be easy enough for them to weed out this sort of postings and refuse them, thus leaving the Datelines of all other *correct* postings intact.

Cheers from Belgium
Dennis

Yes one thought: the only Atari OS that can run on a Mac is MagiCMac and the
point is that you can find very cheap 2hand Mac hardware still very good for
the Atari software, so why not a MiNTMac ?

I would really like to know how "deep" the MiNT code is and if it could be
"easy" or at least possible to port MiNT on a Mac and then start to write
drivers for the Mac hardware (network).

2360. More Atari-MIDI: MasterKeys !

Newsgroup: comp.sys.atari.st
Date: 2001-07-27 13:17:03 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0107270517.1d05c7a@posting.google.com>
Source record: 43077

Hello All

A new program called MasterKeys has been released as Shareware.It is by
Thomas Tegeler.

Take a look here:

http://sites.netscape.net/timconrardy/mkey.htm

Here is some INFO from the Txt file:

==========

** MasterKey for ATARI-Computers - INFO: ***

The program MasterKey uses the ATARI-computer as keyboard-
controler and MIDI-patchbay.
There are hardware-devices for this purpose, they modify the
data sent from keyboards to sound-modules and make it easier,
to switch between complex MIDI-constellations.
But those hardware-devices are often somewhat cripple to use
and somewhat cryptic to program having only small displays.
The computer offers his monitor to make it much clearer,
what You are doing and simplifies to save and load
data to/from disk or harddisk.

*** Some Features of MasterKey: ***

Using an external MIDI-merge-box the program can react upon
the signals of 2 Keyboards sending on different MIDI-channels.

MasterKey holds its data in a "bank" with a "*.KBD"-extension.
In this bank it stores 100 "Patches", which mean 100 complex
MIDI-constellations.

These patches can be used in 100 "Chains", each of them a
series of up to 25 "Steps", which can be "stepped through"
with one click of a program-switch on Your keyboard, with a
mouseclick or a keyboard-click on Your computer or even with
a simple selfmade hardware-device connected to the
joystick-jack of the ATARI-computer.

Each patch distributes the incoming keyboard-data between
up to 6 "outputs". This means it sends the data after
processing them to external sound-modules on their
corresponding MIDI-channels.

For each of those "outputs" the following parameters can be
adjusted:

1. Name of the appropriate MIDI-device
2. MIDI-Channel
3. Keyboard range
4. Transposition
5. MIDI bank-/program-nr.
6. Volume
7. Dynamic offset
8. Dynamic transformation curve
9. Use and transformation of pitch bend up/down, after touch,
3 special MIDI-controlers, all other MIDI-controlers

==========

I have been working with this program for the past few days, and it
is FANTASTIC. Turns your Keyboard controller into a SUPER MIDI
CONTROLLER. The program may be in Black and White, but what comes out
from the speakers is MULTI COLORS. The perfect live performance
machine!

Right now the Docs are in PDF format, however it is in German.

BUT... Thomas has agreed to take on a labour of love..and make a TRUE
ENGLISH translation of the german Docs and create a PDF from it. It
should be ready within 3 or so weeks.

I would encourage everyone here to try this program out.

It is NOT an Algo-comp app, not a Sequencer, but a Midi mapper that
will open Doors to new music.

Ok. I didn't realize WinSTon only read a drive from a specified folder. GEMulator has spoiled me.

Anyway, WinSTon won't load STOS at all. I just get a white screen with the busy bee.

Oh well...

In uno strano messaggio del 22 Jul 01 jba4@po.cwru.edu (2:333/608.1) scrisse
al povero All :

j> Does anyone else have any thoughts on this subject? I've always found
j> the compatibilty in different Atari OSes fascinating.

Yes one thought: the only Atari OS that can run on a Mac is MagiCMac and the
point is that you can find very cheap 2hand Mac hardware still very good for
the Atari software, so why not a MiNTMac ?

I would really like to know how "deep" the MiNT code is and if it could be
"easy" or at least possible to port MiNT on a Mac and then start to write
drivers for the Mac hardware (network).

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

2365. CHAP authentication

Newsgroup: comp.sys.atari.st
Date: 2001-07-27 17:09:06 UTC
From: osian@zetnet.co.uk
Message-ID: <3b61a032$0$18557@news.zetnet.co.uk>
Source record: 43082

It seems we're getting to the bottom of the problem that is causing many of us headaches in trying to connect to Zetnet's new lines. They are BT lines as opposed to Energis, and, quote, "BT do not guarantee that PPP/PAP authentication will work".

It seems Stik and Sting do not handle CHAP - is there any dialler/TCPIP stack that does? And that runs on vanilla TOS - and presumably Stik/Sting compatible so that it will work with CAB abnd Newsie?

Zetnet are keeping their 0845 Energis lines because they are aware that there are many problems with the new lines, but it's unclear as to whether the freephone number will be kept. If it goes, to be replaced with a BT freephone number, we will have to pay full whack for the account AND the phone charges - a little hard to swallow these days. Are there any Atarians successfully using other ISPs?

>conjuction to/from GMT time... simply adding +0200 is enough.

There is no time gap at all. I start to think ASH-mailer has a problem.
You said yourself the mailers uses GMT to sort, so where is the problem?
The time of my posting is correct. GMT or better UTC is the standard time.
Nothing must be added if one really use GMT. I tried out all the
mailers/readers I have. All where displaying my postings with the correct
time. Some converted the time back to local time, others, like Okami just
use GMT.
I really can't see the problem. I post a message at 10:00 CET +0200. The
server converts the time to 08:00 GMT which is correct. Okami will list
that message as 08:00.

Take for instance the messages of this thread.
1) Okami
Pascal Ricard Server date..... 26.07.2001 22:49:26
Dennis Vermeire Re: Server date.. 27.07.2001 10:08:20
Martin "Nightowl" Byttebier Re: Server date.. 27.07.2001 16:09:57

2) MT-newswatcher and Mozilla says 27.07.2001 00:49:26
27.07.2001 12:08:20
27.07.2001 18:09:57

Sorry but I don't see any time gap.

Hello,

Just to let you know (there was a thread in the past about this AFAIK) that the mysterious problems I had with Magic on my CLAB Falcon (bombs, fataler Fehler in Gemdos warnings, white screens lasting for ages, 6 reboots before Magic ran) have disappeared completely from the moment I have changed harddisks. Magic boots up quickly now. I had a 500mb Seagate and now a 10 GB Toshiba internal harddisk.

Cheers
Dan

Hiya

Well you live and learn..

I didn't now it was down to the phone provider to dictate what protocol
to use. I now BT use pap and chap protocols for their dialup services,
but i thought it was down to the ISP itself to chose the protocol!!

Zetnet said that their own equipment will handle PPP/PAP and CHAP, but the qualifier was, as I mentioned, that BT themselves don't guarantee it on their virtual lines. What Zetnet are using must be a 'new generation' of BT lines????

Users on other platforms have had problems too - some have stopped working overnight. And I did actually have limited success with the numbers for a short period. Sounds like it's only a certain number of exhanges or routers or whatever that can handle PPP/PAP, so it's completely random which one you get. Just a thought!

> Last I heard, they were threatening to not let MS release XP...

That would just suck. (not that I'm a huge fan of Microsoft)

How will we ever find out if we can make an OS that's better than
Windows if the government steps in?

I think this should be handled differently. Did Microsoft illegally
kill DR-Dos? the court thinks so? ok, then award damages, move on.

Did they kill Netscape, the court thinks so? award damages.

are they crippling Kerberos? the court thinks so? make them open the
documentation to the proprietary extensions, move on.

Can the US government keep M$ from selling XP overseas? now that would
be interesting if M$ just said, "OK", and then kept selling 2k to the US
and XP to the rest of the world.

The only thing worse than Microsoft dictating what software we have
available to use, is the government doing it.

This hurts the Linux crowd too, if you think about it. We're working our
asses off to get the government to understand that source code is a form
of speech protected by the first ammendment, hoping to overturn the
DMCA, and this just works against it.

There are alternatives to Microsoft, Microsoft is not a monopoly,
everyone just uses windows, there's a slight difference. We could use
linux couldn't we? What about the Mac?

It's not Microsoft's fault everyone isn't using something else instead,
so far Windows has no competition only because noone is competing. There
are alternatives, and they're developing. let the market work it out for
itself. Maybe Linux will catch up and bury Microsoft. I'd rather see
this happen than see XP banned, or Microsoft split up.

What would the government do to Linux if Linux had "embraced and extended" or anything else Microsoft has done? I wonder. Could they do anything, even?

Congratulations! That is, without a doubt, the best argument in this entire thread.

May the software companies be free to do what they do best. Develop and publish software. And the government free to do what it does best, tax the taxpayers.

Gee, I hope I don't get on the FBI's "watch" list for posting this!

Linux COUDN'T embrace and extend... Embrace and extend involves not only adopting and corrupting an accepted standard... It means keeping the additions and changes to that standard secret. (Or refusing to allow it's use elsewhere). Kerberos is the perfect example.

They took the code from the FreeBSD codebase. As FreeBSD license allows anyone to do anything with the source code they want as long as there's an acknowledgement, they extended it and then, when someone found out what the extensions were and posted source code, M$ forced them to remove it from the web.

Looking at what you all say it looks like you want to put an Imac mother board in an mac LC with a cd instead of a floppy.

Windows 3 could run software written for Windows 2 and probably even
Windows 1, not to mention all the DOS apps available at the time.

-a (ps. Punctuation is free, use it!)

Yes, but it wasn't the best software base available, which was *my*
point.

Actually it's because they don't own Amiga any more. If they had released an Amiga under the Gateway name, then what you ay is probably true. However, if they had released one under the Amiga name it wouldn't have mattered. Anyway, this is all ancient history now.

Perhaps I'm out of date, but I seem to recall Gateway creating a a subsidiary
wholly owned, that was to create and sell Amiga/DOS hard/software.

2394. 4Sale - DSP audio clock (44.1)

Newsgroup: comp.sys.atari.st
Date: 2001-07-28 18:05:12 UTC
From: Lonny Pursell <syntax.error@line.22>
Message-ID: <Pine.MNT.4.31.0107281358380.104-100000@Hades060>
Source record: 43120

I have 44.1 khz DSP audio clock for sale.
This is a dongle that plugs into the DSP port and can be used
by DSP apps for more accurate timing. One example is FalcAMP
will use it thus reducing the CPU load.

$25 USD
$3 s&h

Anywhere in the USA.
I prefer PayPal if possible.

Please note by real email address below, I also do not read
this group, so please respond to my mailbox. Thanks.

5$ for the printer and 30$ for the cardrige? :)
You can get decent usb inkjet printers for <80$.
If someone cant spent 40$ on a printer, and can only afford 5$, then they really
need to get creative to refill those cardriges.

They did, and you *are* out of date.

Gateway created Amiga International IIRC, which was wholly owned.
However, they screwed around with various half hearted plans, and
various chief execs, and finally sold everything except the technology
patents to a company called Aminos at the end of 1999. Aminos was
owned by a consortium of people, the two most prominent ones being
Bill McEwen and Fleecy Moss, both enthusiastic Amigans and former
Gateway employees. Aminos has since changed its name to Amiga Inc
(http://www.amiga.com) and they hold all licensing rights to Amiga
technology.

There's quite a lot going on in the Amiga scene at this time.

2397. HAVE ANYONE HAD EMAIL PROBLEMS

Newsgroup: comp.sys.atari.st
Date: 2001-07-28 19:54:10 UTC
From: JOHN NICHOLAS OAKES <doyene@zetnet.co.uk>
Message-ID: <WS3.f55f50fb.7d8a7260.doyene@zetnet.co.uk>
Source record: 43124

Hei all.
Is it possible for a email to wipe out my partition or receive bogu
s downloads on draconis.
Because yesterday that what happened. I noticed while I was downloading a we
bsite to later view.
I received a Blank recurring file without any chance of removing it (TOS 33)
. Then I got another load
of duff files. I checked with my WenSuite to see if there was a similar prob
lem, none as was there.
So I look through Linux my Midnight Commander, to see what they were. To my
amazement it was having
trouble reading them aswell. but I manage to remove them. So thinking the pr
oblem solved I returned
to retreive some emails via Marathon, which worked fine and okay in reading.
But when I came to closing
folder, the whole setup went kaput leaving me looking at a odd file. Is it p
ossible there is a chink
in Draconis armour, because it stems in that area only. Please take out your
pipes and discuss.

regards

John Nicholas Oakes.

For a limited period we're offering the
opportunity of a lifetime.

Make "tens of ï¿½1000's" without selling,
experience, administration, stock, investment
or having to answer the phone EVER again.

Take advantage, get involved with the $35
billion dollar a year adult XXX industry by
taking one of our FREE FREE FREE adult web site
businesses and we'll make sure you earn a lot
of money.

<<<<Its what over 70% of 250,000,000 surfers
are looking for!>>>>

"No experience required"

Our Guarantee:
'We'll give you a adult web site, show you how to
promote it and 'IF' YOU don't start earning over
ï¿½10,000 EACH month within six (with our help),
we'll give YOU the business for FREE'.
When you start to earn over ï¿½10,000 a month,
you pay ï¿½1950.00 once off for the business.

"We already know that you'll reach the ï¿½10,000's
target income quickly"

That's why we don't ask you to part with your money
until you've tasted success.

You don't have to spend a penny to advertise. We'll
show and teach you how to promote it in each of the
4,500 FREE places on the Internet to give you 70,000
to 100,000 customers each month.

You don't need any experience. We'll give you the site,
show you the way and pay you an excellent income. If
you haven't got a PC or experience we will help you
promote your business. With our help, you can't fail.

You can operate anonymously, even your wife/husband
doesn't have to know where the extra money's coming
from. We pay YOU monthly.

We have turned this 'usually expensive to buy
business' into a FREE to start and EASY to operate
package with the entire promotional backup needed
to succeed. We'll teach you everything there is to
know, plus guarantee that you earn over ï¿½10,000 a
month before we ask you for payment. Its a NO RISK
proven business supported by a 'long term sustainable
business plan' that will take you on a roller-coaster
ride to SUCCESS.

DON'T MISS THIS - APPLY NOW

E-mail me for further info: auckland_business@hotmail.com
Limited period applies. FREE support for 21 months.
Domain name required.

Ok, not a good example, I'll pick another one, what if Linux integrated a free web browser into it's interface? What if (hypothetically) this put someone out on the street. What could the government do? Should they do anything?

> Kerberos is the perfect example.

> web.

This is where that double edged sword could hurt Linux. If the government is empowered to bitchslap developers who change protocols to extend them, could not this empowerment also be used to bitchslap developers who reverse engineer protocols to be compatible?
I think the safest ground we could stand on would be that protocols be considered speech, and be given the same standing constitutionally. (Posting the source code is a different story.) Let Microsoft extend whatever they feel like, we'll be right behind them developing tools that integrate nicely with those changes. Both these practices should be protected, as attacking one hurts the other.
This way, any percieved improvements are realized by consumers, regardless what product they choose, and competition is still occuring, with the consumer benefitting from the race. That /is/ the only thing the government is supposed to be concerned with in a monopoly case anyway.
Consumers do not benefit in any way by having the government soft-

enforcing a protocol tweeking taboo.

If you look closely at what's happening to GUI's right now, Microsoft /is/ competing, everyone is. Apple is making drastic changes in it's UI, Linux is also, and Microsoft is changing the GUI at a faster rate than they have ever done anything before. This race they're having is picking up speed and the consumer is benefitting on all fronts. And this is how it should be.

What we don't need right now is Big Brother stopping this race, so that Linux and Mac might slow down, and then we lose because competition has stopped again. Besides, it's getting interesting ;)

What I did to get a decent supply of cartridges for my HP 560C (paid
$7.00 for it at Goodwill) was buy up more printers at the thrift stores
averaging around $5 - $7 each (half that sometimes depending on what
color tag is on sale), pull out the cartridges, then redonate the
printers. One of them even had a couple extra sealed cartridges (2
black and one color.) So I'm set for a while.

I always thought most implementations of Linux included Netscape
Communicator anyway. And Opera would be a good alternative (rapidly
becoming my primary browser under WinBlows-98).

Not true, We sell other OS's, give us a call for a quote, and I'll prove
it.
Microsoft doesn't impose those restrictions on us.

Gateway had other motivations for wanting Amiga.

Compaq puts out other OS's, ones that compete squarely with NT/2000!
Dell, IBM offer Linux.
Not to mention SGI offers unix.

Not sure where this rumor started, but I've heard it before.

Some do, some don't. (Debian, for instance, can't under its license.)
You also often get lynx, links, KDE's browser (Kylix? I forget) and so
on.

This is very different from integrating it into its interface, or some
other such nonsense which assumes all OSes work like Windows.

Nothing. Linux is not the product of a company that has a monopoly. So none of
these questions apply.

> Should they do
> anything?

But they aren't so empowered.
It's really very simple. The rules you have to play under change once you achieve
monopoly status. You may not use your monopoly to maintain or extend your
monopoly. So Micro$tuff is a very special case that doesn't apply to hardly any
other high tech company (possible exceptions: Intel and IBM [IBM once came close

to a breakup because of it's abuse of monopoly power, they backed down and played nice, something Micro$tuff doesn't seem to understand how to do])

Roy

> could not this empowerment also be used to bitchslap

Here's how it has worked with their "extensions", they made changes to Win 95 and Win 98 at the request of the Office programmers. Not too much wrong there. They made such changes available to the WordPerfect and Lotus Suite programmers, once those programmers learned of the existence of the changes, and then asked for the information.

Do you see the difference? In house products teams had weeks, if not months lead time so their products were out first, and had a much closer working relationship with the Systems programmers than ANY competitor could possibly have. That allowed the Office products to maintain and extend their lead over their major competitors. American law prohibits that as unfair when done by a monopolist.

The kicker is that Micro$tuff is STILL denying that they have a monopoly. I suppose they would only acknowledge it when/if they achieve their wet dream of all computers everywhere using M$ OS.

Ah, but what happened to DRI?
How often do you see the Lotus Office Suite (assuming IBM didn't finally throw in the towel) bundled with a computer? Or the WordPerfect suite? How much shelf space do they get at the Best Buy, Office Max, Office Depot, Circuit City, compared to M$??

>
>
> What we don't need right now is Big Brother stopping this race, so that
> Linux and Mac might slow down,

You won't. Big Brother might slow down M$, but not competitors with less than 10% of the market place. In a case like this, Big Brother's job is to make sure that the race is fair to the little guys.

(sigh!) you're missing the point. Make something up yourself. We're not talking about what linux is, we're talking about what the government should be/shouldn't be able to do.

Anyway, linux isn't like /anything/, "linux" is just a kernel, I can make the "linux OS" anything I feel like dear. kernel 2.4 has a built in *web-server*, by the way, by "built in" I mean right in the kernel.

Not even Microsoft has a webserver in the kernel, so, how does "linux work" again? ;)

>(sigh!) you're missing the point.

Nope.

> Make something up yourself. We're not
>talking about what linux is, we're talking about what the government
>should be/shouldn't be able to do.

And you're making some spurious links to Linux, not understanding the first thing about what you're talking about.

Remember: Just because MS do their Operating Systems one way doesn't mean all Operating Systems work that way. Hence, what the Government do there doesn't apply to some other OSes - because it's entirely irrelevant to them.

Government: "Microsoft, no integration of browser with OS!"
MS: "Squeak! Yes sir!" (eventually, maybe)
Government: "Linux, no integration of browser with OS!"
Linux: "Erm, we don't."

You're trying to make links between two entirely incompatible situations. What a Government can/can't do with Microsoft is entirely different to what it can/can't do with Linux - because the entire system doesn't work like that.

Free clue: When giving examples and analogies, try harder to make them relevant.

The question was hypothetical, the situation posed in a hypothetical
question need not be fact. The question I asked was "what if", and it's
an interesting question, what if Netscape decided to become available
free with every linux disrobution and became the almost exclusive
browser? what could the government do?

If that was the case, then "embrace and extend" would be moot anyway.

A monopoly means more than "most people use Microsoft." Microsoft does
not have a monopoly. Even, of all people, RMS has stated that everyone
has a choice of what OS to use. A corporation is not a monopoly because
the free will of the people chose one product over another.

Case in point: IBM, you /could not/ built an IBM PC without an IBM PC
BIOS, therefore IBM had complete /exclusive/ controll of the market,
regardless of the purchasing decisions of the consumer. This is what a
monopoly is.

(By the way, we broke that monopoly by reverse engineering the BIOS,
see? Kind of like the kerberos example. The court should do the same
thing they did then, allow an implementation of that functionality to
be duplicated.)

Microsoft, on the other hand, was voted to where they are now by the
purchasing decisions of the free willed people. There are alternatives,
for crying out loud Microsoft has one of the hardest competitors in the
world to compete with, a competitor who /gives it away/ (sound
familliar) and has both the popular and (arguably) technological
advantage over them. Not just in the OS market, but (especially) the
server, and (mostly) the webserver market. Microsoft's momentum is
/hardly/ increasing, and more and more options are developing every day.

> Win 98 at the request of the Office programmers. Not too much wrong there. They
> made such changes available to the WordPerfect and Lotus Suite programmers, once
> those programmers learned of the existence of the changes, and then asked for the

> information.

A lot of competing companies had inside knowledge of Windows, look at
Adobe. Adobe knows more about the inner workings of the Windows Print
architecture than Microsoft. You know why? Adobe /designed/ it! The
public was highly skeptical about the quality of it before release, so
Microsoft called Adobe in and had them completely overhaul the entire
print archetecture. (there's actually a neat story behind this too)
How about the inner workings of Microsoft Networking and the NetBEUI
protocol? Did you know that it was ProComm who put that there? NetBEUI,
Microsoft's "plug-and-play" networking protocol, was purchased from
them.
Adobe has been successful in Windows printing, Procomm in networking.
Microsoft doesn't even have the edge on alot of the code they themselves
distribute.

> Do you see the difference? In house products teams had weeks, if not months lead
> time so their products were out first, and had a much closer working relationship
> with the Systems programmers than ANY competitor could possibly have. That
> allowed the Office products to maintain and extend their lead over their major
> competitors. American law prohibits that as unfair when done by a monopolist.

But the fact that others were developing and releasing competing
products, and making money doing it, precludes Microsoft from being a
monopoly at that point in time. If you remember, Lotus was very
successful. In the end we mostly moved to MS Office because we liked the
product better, if we didn't we, to this day, still have the choice of
using other products. StarOffice comes to mind as an excellent
alternative (I can't stand the interface though)

> The kicker is that Micro$tuff is STILL denying that they have a monopoly. I
> suppose they would only acknowledge it when/if they achieve their wet dream of
> all computers everywhere using M$ OS.

I deny it too. I have plenty of options. I'll deny it untill there arn't
any options. Then it will be a /monopoly/. A monopoly means NO options.
Like Bell telephone, IBM making the only machines with an IBM BIOS.
OPEC. Let's face it, it was Darwinism that built Microsoft, it's
Darwinism that will bring it down, and it can and /is/ happening.

> > Both these practices should

> > /is/ competing, everyone is. Apple is making drastic changes in it's UI,

>
> On yeah, and how much has their market share gone up?

Not relevant. It certainly can't be because of Microsoft Office,
because Office on the Mac is better and more stable than Office on the
PC (from what I've heard). This is (from "what I hear") typical, I hear
Photoshop and alot of other apps that exist on both Windows and Mac are
better on the Mac. This tends to put a few holes in the theory that
Microsoft giving inside Windows OS info to Office developers made
windows more popular, because that Windows OS Office is supposedly
inferior to the MacOS Office, regarless of "inside knowledge"
And the kicker is, You can have all the inside knowledge of the MacOS
you want now, at least the "Darwin OS" parts because it's OpenSource. So
according to the inside knowledge leads to market monopolization theory
posed, the Mac should be cleaning up, right? So how much /has/ there
market share gone up?

> > Linux is also,

> space do they get at the Best Buy, Office Max, Office Depot, Circuit City,
> compared to M$??

About the same amount as the customers ask for them. Shelf space does
not a monopoly make, When I decide what to stock, it's based on demand,
and customer demand is the free will of the people, nothing more.

> > What we don't need right now is Big Brother stopping this race, so that

>
> You won't. Big Brother might slow down M$, but not competitors with less than 10%
> of the market place. In a case like this, Big Brother's job is to make sure that
> the race is fair to the little guys.

And what have the "little guys" been doing? Generally nothing untill
Microsoft develops something they need to compete with. There's been a
lot of companies resting on their laurels untill they /have/ to improve
something because Microsoft is killing them. Don't believe me? let's
take a closer look...

PalmOS, who swore up and down consumers don't need color. fine everyone
settles for b&w, and Palm own3Z the market. WinCE comes along, and Palm
responds with the new color models, but by now they're already losing

market share daily, and the palm VII I *just bought* is now on fire sale as best buy for half the price I paid a few months ago for it.

Novell, once prime master of the universe in networking, decided it didn't want to make a VXD implementation of Novell client for Microsoft right away, they decided their legacy .386-file architecture was all anyone needed. Microsoft, who at first didn't even install networking protocols in win95 by default, and even included a limited novell client, responded to the delay imposed by novell by incorporating NetBEUI (mentioned above) as a stop-gap measure untill novell woke up to consumer demand. Too late. novell is now largely irrelevant.

OS/2, an Operating system more object oriented than Windows is /to this day/ practically abandoned by it's creators even though people are practically begging them not to discontinue it. It's still a staple in most banks and runs a majority of the ATM machines out there. IBM has publically stated they don't plan on supporting this OS.

BEOS, a very capable OS, but one that it's creators have no interest in persueing, deciding they want the embedded market, despite a loyal following of users and tinkerers. Heck, by the time I even discovered BEOS, they had already abandoned it!

On the other hand, there are very good developers out there that make a killing competing against Microsoft because they are /good at it/ and the consumer /prefers to use them./ Adobe is a prime example here, as are Macromedia, Citrix, Borland, Sun, AOL, Symantec, Peachtree, Intuit, and many others. They have prospered because we vote for them with our patronage when we choose them over Microsoft. They have responded to the demands placed upon them by the consumer, faster or better than Microsoft has, and thus prospered. This is how it oughta be.

Some people may feel sympathetic to Netscape, but the fact was they were charging money for a product that could have taken on microsoft and won, but they decided they preferred to be Adware instead. they could have improved their product, but they decided to open a portal during the portal craze and rest on the portal, and their laurels. If Microsoft didn't do it, someone else would have.

that's the thing in a free market, you live with the fear that someone will be faster, better or cheaper than you are. You adapt, or you win the Darwin award.

Anyway, back to your original comment, the government's job is *NOT* to make the race fair to the little guys. the goverments job is to make the race fair and beneficial to the *consumer*, even if it means the "little guy" goes out of business. the government has the power to grant monopolies for this purpose so long as it benefit's the consumer.

But again, Microsoft is where they are because we put them there, and it's in our best interest to let them compete.

Actually, now that we somehow got our shirt stuck on this nail that
wasn't relevant to the subject at hand anyway, just kind of provided
like a freehand sketch for those that lose interest in the text without
pictures version...

Linux is not an Operating System. It's not up to "Linux" what gets integrated into the OS. Redhat, Slackware, ect are Operating Systems, They decide what gets integrated into the OS. Linus is just a kernel.

The Analogy was NOT between "Windows and Linux", The analogy was between two "Equally /available/" operating systems. the consumer has the same access to one as the other, illustrating something not true in a monopoly.

As for (re: linux) "They don't do that", who are "They?" and what dictates what "they" do? Is not Linux open for anyone to do what they please? In my "Linux on an Amiga in a Box" half-hearted kill-time project I work on ocassionally, should I contact "them" to find out what I can and cant do because "we dont do that?"

Unless Linus has contacted the hundreds of copyright holders on the various pieces of code, and they all decided to stop distributing the source under the GPL, I'm pretty sure I can integrate anything I damn well please into the kernel, or my OS. Of course it will be tricky, as I'm using the uClinux kernel so as to make it work on older Amiga's without an MMU/and UAE, and I can't get the file system to work, even though everything "should work" (I'm abandoning it soon I believe, I've decided it's time for a new project, a gnutella client that doesn't suck)

Back to the point, the question (again) isnt like you said, "What they can/can't do", I asked what they "Should/shouldn't be allowed to do", this isn't a question of opportunity or current legal precidence, but a hypothetical question of ethics and what level of government inervention is beneficial to the consumer, and why.

The answer to that question is they should either A) side with the small businesses being hurt by Microsoft, or B) side with the consumer, who chooses to use the Microsoft product over the competitor.

I wasn't expecting C) "Linux doesn't work like that", and I apologise for my foggy analogy. The illustration was an afterthought ;)

> the harddisk, but I'm under the impression that something more is needed
> for a CD-ROM drive.

Yes, it is !
You also need ExtenDOS http://www.cyberus.ca/~anodyne/

> I'm going to try things out to begin with using an old
> 2x Apple Macintosh CD-ROM drive (with caddy-loading), then buy a modern
> one once I get that working.
> By the way, are there specific drives that have to be used, or can any
> SCSI CD-ROM drive be used with the ST?

I'm using a MATSHITA CR-504-J external CD-ROM x12, and that's work very well
with The Link 2 (ICD) and ICD SCSI Link Utilities or HD Driver, and of
course ExtenDOS ...

Bye ...

2419. [ANN] Joe & Rosemary

Newsgroup: comp.sys.atari.st
Date: 2001-07-29 11:00:58 UTC
From: ptonthat@club-internet.fr
Message-ID: <9k0qda$9pr$2@front7m.grolier.fr>
Source record: 43140

Bonjour :)

You can find a Joe's bugfix on my homepage (http://www.multimania.com/nef).
Features :
- fixed a big crash during communication between Joe and its modules
- Hope to have corrected the menu and dialog box slowliness under MiNT
- use of XRSC for external ressource files (RGF method), if you have problems with it, rename the \MODULES\XRSRC.OVL as *.OVX.
- keyboard overrun behavior improvement
- some internal small bugfixes
- Well formed HTML. You can desactivate it (ie <IMG/> -> old <IMG>).
- ISO-8859-1 Filter. You can use no more &entities; (please read the bugfixes.txt)

This version is not MiNT Memory Protection compatible. Tests were excellent with LicomLIB and its compilator, but there's a niggle (memory fragmentation) in this library that nearly forbids Joe to run in monoTOS.
If you really want a MP mode compliant, e-mail me and I will compile Joe with RGF's library, but you should use it only under MiNT or MagiC.

To pardon me about my late, I have released Rosemary sources and its image maker under the SGF license (SGF for "Schmilblick Goes Forward"). 'Tis same as GPL, but for GFA ;-)

Note that DGEM will obey to this license (sources and dev-tools released), when I will finish the 0.14 version.

Bye

Rajah Lone of Renaissance.

> free web browser into it's interface? What if (hypothetically) this put
> someone out on the street. What could the government do? Should they do
> anything?

Linux doesn't need to "incorporate it into its interface" in the way you
mean... There are several free web browsers included with every linux
distro. And yes, depending on which windowmanager/desktop environment you
choose, there are integrated ones. But not of them are forced on the user.

And as the source code is free... It would be easily UNintegratable if
someone DID want to reassert their choices.

>> Kerberos is the perfect example.
>> They took the code from the FreeBSD codebase. As FreeBSD license allows
>> anyone to do anything with the source code they want as long as there's an

> This is where that double edged sword could hurt Linux. If the
> government is empowered to bitchslap developers who change protocols
> to extend them, could not this empowerment also be used to bitchslap
> developers who reverse engineer protocols to be compatible?

Think of it this way. Someone working on FreeBSD wrote that kerberos
protocol. OK, he released it under the FreeBSD license, but when M$ extended
it, did he get anything for it? Did he even get to see the changes?

That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code
legally without releasing any changes they make back into the community.

> I think the safest ground we could stand on would be that protocols
> be considered speech, and be given the same standing constitutionally.
> (Posting the source code is a different story.) Let Microsoft extend

> be protected, as attacking one hurts the other.

fine... let them keep the source, but they DON'T publicise the actual
protocols... Hell, even their own protocols (word document format anyone?)
aren't fully compatible with each other in an attempt to force people to
needlessly upgrade their software.

Yes, and looking at the positive side of this, it's really good that
a small platform has more than one OS. This might make software
development more hard for programmers but gives people the ability
to choose between different implementations on the way to achieve
a certain task. In a world full of standards, this can't be bad :-)

Even 'battles' give sometimes a liveness to the platform, especially
when they contain constructive critisism. I know this is not always
the case, but at the end, peace returns back to the platform :-)

Well, it's really nice to connect to the internet and be able to use
some 20 clients at the same time, checking, comparing, evaluating them
(the best method to disorganize your mails :-).

>
According to Andreas Kromke, MagiC threads "are modelled on the concept
of Sun Solaris 2.x". THREADS.TXT is in the AES folder and a thread
is started with shel_write (SHW_THR_CREATE, ...). After that, a MagiC
thread behaves like a separate process with its own ap_id.
A multitasking-safe lib is also needed (like MT_AES.LIB).

After all this, I think there might be hope if Henk Robbers makes
his magic ;-) in XaAES taking the above call and passing it to the
underlying MiNT threads. I have no idea if it can be done, just
an idea...

>
I'm sorry to hear that. For the moment I know that the PCI and ISA
versions of the NE2000 and compatible adapters (by Torsen Lang) work
just fine on Hades and Milans and my RTL8012 pocket driver on TTs,
Falcons, STs etc. The PLIP driver also works OK.

If you mean riebltt.xif, this is where I get on my TT (without the
adapter)

---------- BOOT.LOG ----------

pMAGX-NeT dated Jun 26 2001q
MagX-Net 1.3 PL 7, beta
© 1998-2001 Vassilis Papathanassiou

Loading interfaces:

```
MagiCNet - MiNTNet RTL8012 pocket driver
version 1.3 (en0) (0:c0:df:68:9e:79)
........

AM7990: driver for RIEBL VME (TT) (C) 1996, 1997, 1998 by T. Lang
AM7990: driver for RIEBL VME (TT) not installed, board not found.

.........
----------- BOOT.LOG -----------
```

This means that up to this point some MiNT kernel calls have been made and if the adapter is found, then the driver installs the interrupts, VBI (no problem) and maybe HBI (never tested on MagiC).

What I'd like to know is if the crash happens during the init phase or when you try to send/receive something. This will greatly help me to find out where the problem is (and hopefully fix it :-)

Source record: 43015

FamilyNet Newsgate

The ST is currently used for 80- column interpretation for my Atari 800
through a null modem link.

So currently I am typing away on the Atari 800, and there are term programs
running on the Atari 800 side and the ST side.

But for the ST side, when I'm not in terminal mode I need a virtual
keyboard to type in names for folders, modify files and settings, etc.

So, I have a solution for part of it. But the ST side could use a simple
virtual keyboard for what I mentioned. If there was a way a I could enter in
information and then cut and paste from the terminal window to a text entry
field elsewhere... that too would work.

Open to suggestions on a virtual keyboard or a good cut and paste solution.

Use the Link II, I never managed to get my GE board to talk to anything but
drive 0.
Nothing else needed but software, I recommend HD-driver and Extendos.

Hei All.
Time for a clear out of several software suitable for someone starting out or don't have.
All prices at ï¿½5.00 each and ï¿½1.00 for postage if uk resident quite happy for currency or cheque.
Or postal order if outside uk.
ITEMS FOR SALE:

1.STFormat book and Disks
2.SpeedoGDOS V4 and Manual
3.Draconis Pro v6 and Manual
4.WenSuite v2.40d and Manual
5.Trueimage/Truepaint and Manual
6.Easytext Pro and Manual
7.NeoDesk3 and Manual
8.EZ-Art Pro and Manual
9.ST Tabby and Manual (Software only for the graphic tabby)
10. free giveaway gratis don't want it
Flexidump and Manual
AMICDROM Driver.

Checked and all still working.
Please confirm by email.

I have Marathon somewhere on the HD but I never have use it for the
simple reason I never succeeded to make a connection to POP3 mailserver.
Judging the terrible quality of Adamas I should say yes, it's very
lickely Marathon can do such devasting things.

>Because yesterday that what happened. I noticed while I was downloading a we
>bsite to later view.
>I received a Blank recurring file without any chance of removing it (TOS 33)
>. Then I got another load
>of duff files. I checked with my WenSuite to see if there was a similar prob
>lem, none as was there.

Also it seems Wensuite has some troubles to make legible mails. Lots of
words are splitted over two lines. A sentence stops somewhere in the
middle of a line, the rest of the sentence goes further on another line.
This all makes that it's rather hard to read your postings.
BTW: TOS -33 means file not found.

I should say put the whole Draconis thing in the dustbin and get a decent
mails/news client. If you only looks for a mail client gets Mymail
or Amail. If you want a combined mail/newsreader gets Okami or ASH-mailer.
All mentioned clients are far better then that marathon and Wensuite
thingy.

HTH,
Martin

I think you are missing the point. Rolls Royce still make cars to a standard not to a price. Kit cars (usually VW based) are still available. I think a "kit computer" is a nice niche idea. I certainly subscribe to the idea behind it.

2443. Re: SCSI CD-ROM with ST?

Newsgroup: comp.sys.atari.st
Date: 2001-07-29 17:49:00 UTC
From: Ekkehard_Flessa@wun.maus.de
Message-ID: <200107291949.a17539@wun.maus.de>
Source record: 43020

Hallo Hallvard!

HT>I've got both a GEsoft (without parity, but will build a parity
HT>generator) and an ICD Link II host adaptor, and HDdriver software for
HT>the harddisk, but I'm under the impression that something more is
HT>needed for a CD-ROM drive.

That'll be just fine, but additionally you'll need some CD-ROM driver software.

There are several opportunities:
- METADOS plus drivers by Atari, rather outdated. IIRC those were available for the ancient CD-ROM drive by Atari and might work with other drives on the ACSI bus.
- CD-Tool by Hard&Soft, commercial but AFAIK no longer available.
- EXTENDOS by Anodyne, commercial and quite good. http://www.cyberus.ca/~anodyne/. Recommended if you would like to burn CDs, as anodynes CD-Writer-Suite relies on Extendos for all CD access.
- SPIN! by Julian Reschke, shareware, available from http://www.muenster.de/~reschke/soft_e.html. Also quite good, with native MagiC and MiNT support. Latest Version available to registered users only, but the one on the web page is quite usable.
- EGON, commercial (I ain't got any more information)

HT>By the way, are there specific drives that have to be used, or can any
HT>SCSI CD-ROM drive be used with the ST?

There shouldn't be any limitations. Even CD burners should work, but those tend to need initiator identification and/or parity.

>revenge,

I've blocked just over 20,000 in there from Dip Slime today, mostly
posted through news20.bellglobal.com. I still had to download the
headers just so the kill rules could drop the articles, and on a 56k
dial-up that sort of flood just isn't funny. It's almost making the
newsgroup unusable :(However, with luck, the more Slime does it, the
more servers are going to become secured and the less he/she/it will be
able to flood like he/she/it is doing now.

I'm afraid there is a misunderstanding here. Probably they have unix
in mind and confuse it with MiNT ? I was supporting another TOS (!)
system in the past (Targon Operating System by Nixdorf Computer),
a Unix System V OS, and the arguing between colleagues both here and
worldwide was again about graphic environments or the good old shell.

I wouldn't be surprised if some MiNT haters ;-) have something like
this in mind, considering the fact that MiNT started as a command
line only OS. Things have changed of course and today one can have
an all dancing all singing MiNT system on a fast computer with
(preferably) lots of RAM but sometimes it's hard to change one's
opinion, if she/he had a bad experience in the past (the same is
true for those that don't like MagiC for one reason or another).

Anyway, over the years I've learned that the best OS/environment is
the one that makes his user feel comfortable working with it, there
are times I'd like to work on a Unix system and times where Single
TOS is just fine for what I'm doing.

Well, that's the simple case! What about this ?

ifconfig sl0 addr 44.154.0.28 dstaddr 44.154.0.26 netmask 255.255.255.0 mtu 1500 link04 up

(91 chars long :-)
It needs 2 pages explanation and it's very easy to make a typing
mistake. If you don't need the interface for a while, simple:

ifconfig sl0 down

but if later it has to go up again one has to manually add the route

ifconfig sl0 up
route add 44.154.0.26 sl0 (and this without a gateway :-)

I'm sure you'll find out it's easier to do it with NetConfig while
your rc.net will still remain the same.

> > > Surprise ;-), an IConnect gateway is been betatested right now. For

I found it much easier than GlueSTiK. The problem is it has to respond
to some GEM messages and since apps search for 'ICONNECT', its name
should be ICONNECT.PRG! I hope there are no legal problems with it,
I'll check it before release.

> > Hehe :) MiNTnet/MagiCnet would make sense as "standard" these days,

Well, we live in a free world (at least we think so). I swear I'll
not force anyone to use a BSD -> MiNT -> MagiC TCP/IP stack :-)

Regards,
Vassilis

Why should they have to though? What extra power would my parents get (word processing, internet, dtp, spreadsheet) by using Linux over Windows or her Mac (actually my old Mac)? What advantages would I have in using Linux over Windows as an application programmer using VB, C++ Builder, VC++, Jbuilder, SQL Server etc?

> --
> Security-wise, NT is a server with a "Kick me" sign taped to it.

And there are not dozens of known security holes in most Unix/Linux distributions? Every scanf(),gets(), sprintf(),strcpy in the OS is a potential security hazard.

The GEsoft will work. I had an old NEC 3 speed connected to it while
using Spin 0.34, Magic 5, HDDriver 7 and SCSIDRV 5.02 (maybe from CBHD,
can't remember for certain). I had parity was disabled on the CD (it had
a jumper to do so :) and it worked just fine.

>By the way, is parity recommended to be switched ON if the host adapter
>supports it, or do things work just as well without?

In my situation it worked without parity. YMMV

It does... Linux is not just a basement hacker OS runned by kids living on their mother income.

sigh

Which particular Linux "interface" are you referring to?

Free clue: Linux doesn't have any one single interface into which a web browser can be integrated, unlike some other OSes. Similar things apply to many Unix derivations/clones/flavours etc. Given the open-source GPL nature of the Linux, it would be nigh on impossible to integrate something in a manner such that it couldn't be unintegrated and, in many ways, Linux is essentially the kernel and helper apps. The interface is virtually entirely customisable, since all the kernel hooks are well documented and available to all.

But it seems like that's how the hardware support comes about. It seems like you pretty much have to buy peripherals that have been out for about 3 years to get full support in Linux.

This right here is what I am thinking. A lot of other posts in this thread have talked about PC components. Come on people! PCs are no fun! We all like our obsolete computers (whether you consider them obsolete or not, I personally couldn't find anything useful to do on my Atari if I tried) right? We just want something a little more powerful so we can do all the things we need to do and throw out those stupid PCs which are just a bunch of parts sloppily thrown together. Even if there were an OS for PC that we liked it wouldn't matter much because PC hardware just sucks. Maybe you don't agree but this is certainly my opinion. I'm an assembly language person and I find C++ (the language that "everyone" uses now) to be completely unnatural. It isn't practical to program PCs in assembler because there is so much different hardware (can't find programming info for most of it either) and because most of it looks like it was designed by crazy people.

Sooo... I use my PCs for internet access, for games (just emulators and Doom network games actually), for playing music, the occasional school assignment, and for programming (for non-PC systems of course, like the Turbo Grafx 16 for which I've written half of an RPG in Hu6280 (like a 6502) assembly). One of the many things I like about my Atari is the fact the motherboard is not too dense, I can go in and unsolder stuff and solder other stuff on. There is no way to do that with a PC motherboard (at least on anything newer than a 286) because of all those tiny little pins on the chips and the four-layer construction. Taking all of this into account, my system would look like this:

1. nice, simple CPU (since I'm a fan of the 6502 I'd use one of those great Western Design Center 65816's. one of those eZ80s that I've heard about would be good I guess. 80x86 chips are out of the question of course), with a clock speed

in the double digits (decimal digits, not hex :))

2. 2 MB or so of RAM would be fine for what I'm doing

3. A cool video chip like old computers had, that means something other than just a frame buffer and a DAC, something with sprites and layers and maybe polygons. I would like something with 256 colors at 640x480 (the V9990 chip used in the 3DO would be great, the chips from the later MSX computers would be OK)

4. A likewise sound chip, something with 16-bit stereo PCM but also with some good old FM channels or square waves or something

5. an EIDE interface

6. built-in ethernet

7. some REAL joystick ports (the kind where you read a register and each button is represented by a bit)

8. expansion slots

9. An OS which isn't bloated and slow, which includes a command line interface, and which isn't designed to protect idiot users from themselves

Perhaps within the next year or two, when I have some money and some time, I'll build something out of a 65816 development board. Then again, I might spend all my money on mods/paint for my BMW (which is around the same age as my Atari 8-bitter of course).

And I answered your question with a real world answer. The US government, at least does not now have that power. The only power they have to do anything like you asked is only if the corporation in question is a monopoly, and is using it's monopoly power to extend or maintain it's monopoly.

Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for that), and Linux isn't the product of a monopoly, there isn't a hypothetical to ask, unless you first suggest that Congress passes a law that isn't even in question, and that the President's veto isn't overridden, and that the Supreme's say is constitutional. That

isn't hypothetical, that's a chemical induced nightmare. ;-)

Monopoly does *not* mean that *everyone* uses your product. AT&T was a monopoly, even though there were several other competitors (GT&T, IT&T, here in eastern Nebraska there was LT&T, and so on), AT&T was a monopoly because they had a super majority of the business, and there was no way that any of the competitors could take the monopoly away from them.

Besides, your opinion doesn't count, and neither does mine. The trial court found that M$ *is* a monopoly, and the appeals courts sustained that decision.

c. 90% of computer desktops does equal a monopoly.

> monopoly is.

LOL - no, not at all. Ever hear of Phoenix bios? Award Bios? Ever hear of Dell, Compaq, Tandy? They all made machines that were IBM compatible, and IBM long ago lost control of the market. How silly of you.

IBM's monopoly was in mainframes, and even there they had competition. But they used their monopoly power to squeeze the competition, which is why the Feds came down on them. IBM settled out of court. M$ isn't that smart.

>
>
> (By the way, we

We?

> thing they did then, allow an implementation of that functionality to
> be duplicated.)
>
> Microsoft, on the other hand, was voted to where they are now by the
> purchasing decisions of the free willed people.

Not really. M$ makes their money on Office not Windows. And of course, not on Explorer. But Navigator was a threat to Widows as a platform on all OSes, and therefore a threat, in time to Office and M$'s monopoly.

So they cheated.

They did what was illegal for them to do at that stage.

> There are alternatives,

Oh yeah, GEOS is taking the world by storm, isn't it?
How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot, Sears, and Walmart have Linux pre installed on them? Have you seen ANY??

How many machines do you see in those stores that have applications software (Works or Office type) that are made by a competitor of M$? Have you seen ANY?

>
> for crying out loud Microsoft has one of the hardest competitors in the

You don't have to have a monopoly in every niche to be a monopoly.
And Linux hasn't won even in these fields - yet. It certainly doesn't have a monopoly even in those niches.

> distribute.

Adobe isn't selling an Office suite either are they?
Office is M$ bankroll.
By the way, how much do you hear about Novell and networking any more? A real powerhouse like they were in the early 90's right?
And M$ often buys technology, that's not news. Nor does it have anything to do with their having a monopoly in Office Suite or on Desktops.

Did you notice what happened to Stacker? Or After Dark? Products that aren't sold, in part, because M$ bought such technology and incorporated into their software, so consumers didn't need to buy and so didn't buy such products.

See, that's a real problem. If you get M$ Office for free, why would you buy WordPerfect? If you get a screen saver for free, why buy After Dark? If you get a browser for free, why buy one?

And when such actions are done by a monopolistic company, it's illegal.

Hm? With the possible expection of SB Live!, my keyboard and mouse and
disk drive (newer than three years, but the designs are not changed, I
guess), there's no components that are even nearly three years old on
my Linux box.

(Other hardware includes TB 1200, A7M266, Geforce 2mx, two IBM
Deskstar HDs, HP 9120 CD burner and two NICs - all which is rather recent)

Didn't have a single problem with this configuration.

Then again, I'm not using USB stuff but rather more 'traditional'
hardware.

Yes, a CD-ROM driver.

> By the way, are there specific drives that have to be used, or can any
> SCSI CD-ROM drive be used with the ST?

It's like with any other SCSI peripheral: Basically any drive can be
used. But drives that have parity checking enabled require a SCSI
hostadapter that generates the parity bit.

Parity maybe yes, but initiator identification? Which burners require
this?
(For those burners a LINK96 or LINK97 adapter would be required.)

If the adapter supports it you should turn the drive's parity checking
on. This enables the drive to detect transmission errors.

This one's easy (although I wouldn't say Red Hat "sucks")

For starters lets take a look at the included version of GCC.

Can you even recompile the base kernel with it?

I wouldn't say any OS sucks because of the "ease of installation"
because if the OS is worth it's salt, you're only going to install it
ONCE anyway.
However, the compiler thing, I just have to sit back, shake my head and
wonder what WERE they thinking?

Easily, maybe, I can also easily unintegrate IE from Win98 too, there is
a way to do it ;) (Was quite an embarassment too, after MS said they
couldn't!)

In my personal opinion, I really hate the BSD license, for this very
reason. I mean, it's fine if you don't WANT to see your code when it's
reused, but I wouldn't choose it.

> That's why I prefer the GPL over FreeBSD. Microsoft CAN'T use that code

That's why I save everything in Word 6 format ;)

In the case of kerberos, they did publicise it, in fact, they publicised
the source code. While the NDA keeps you from using that source code, it
doesn't keep you from implementing the protocol.

2467. RAM Card for Falcon?

Newsgroup: comp.sys.atari.st
Date: 2001-07-30 06:49:42 UTC
From: swampfax@atlantic.net
Message-ID: <as797.16$tl6.40729@news1.atlantic.net>
Source record: 43032

Hi All,
I'm curious to know of the availability and cost of a 14 meg RAM card
for the Falcon MKI and can they be bought new? I have the "Gizmo" in there
now but it's bad for the Phantom SE. In case anyone has info on it, the
cards that I CAN'T use are:

- GIZMO
- Falcon WINGS
- original Atari 14MB RAM card
- any other card with 4x4MB short SIMMs

So the suggested solution is a modern 14MB RAM card with 72pin SIMM

Replies welcome here or at my E-mail address swampfax@atlantic.net

Later,
John G.

LOL I love that line ;)

There are things in linux that it really is harder to do than in
Windows, but these things (like routing, wierd protocols like PPPoE)
are things usually done by someone who should probably spend a little
time learning anyway.

Sure linux has a learning curve, but it's a freaking computer, when did
the notion that computers had to be usable by people who didn't want to
learn anything become popular?

Try Atari Workshop (http://ww.atari-workshop.co.uk) they sell a Falcon upgrade board that requires 1 x 16Mb SIMM, unfortunatly you have to source your own SIMM and at £49.95 + VAT it is a tad expensive.

```

The question (as posted in another article) had nothing to do with the
power they now have, but what power they should have, and why.

> Since Netscape isn't a monopoly (not even being owned by AOL qualifies them for that),
> and Linux isn't the product of a monopoly, there isn't a hypothetical to ask, unless

> isn't hypothetical, that's a chemical induced nightmare. ;-)

But the question was what if they were, saying "but they're not" changes
the question.

A monopoly means the consumer has no choice. As for AT&T, I never had a
choice. I can choose alternatives to Microsoft.

> Besides, your opinion doesn't count, and neither does mine. The trial court found that
> M$ *is* a monopoly, and the appeals courts sustained that decision.

LOL, we are talking about opinions here. I don't pretend that anything I
say is going to be passed as law :)

That proves my point, the government didn't break them up, Phoenix made
a clean-room implementation of the BIOS, allowing machines to "truely"
be IBM compatible.

> IBM's monopoly was in mainframes, and even there they had competition. But they used

;)

I'm sure you could think of an alternative if you tried.

> How many consumer machines at Best Buy, Circuit City, Office Max, Office Depot, Sears,
> and Walmart have Linux pre installed on them? Have you seen ANY??

I sell them. If you wanted one and can't find one I'm sure I could hook
you up.

> How many machines do you see in those stores that have applications software (Works or
> Office type) that are made by a competitor of M$? Have you seen ANY?

Emachines come with StarOffice, and are sold at OfficeMax, among other
places. We offer Corell Office 2000 in addition to MS Office 2k, along
with StarOffice and a few others.

> even in those niches.

The problem is that "monopoly" is becoming too loosely a term. Microsoft
may be guilty of unfair marketing practices, but "monopoly" they are
not. There are choices, and the consumer can choose anything they want.

The governments role is *not* to protect other businesses from
microsoft, but to protect the *consumer*, and right now, the consumer
has choice. if the government happens to do something like pull a
product that the consumer WANTS, then the government is stepping on the
rights of the consumer in favor of the businesses that wern't chosen by
the consumer.

Adobe competes almost squarely with Microsoft Office in many areas.

Pagemaker -> Publisher happens to come to mind.

> By the way, how much do you hear about Novell and networking any more? A real
> powerhouse like they were in the early 90's right?

This was mentioned in another post, they dropped the ball when Win95
came out. What happened to them was they rested on their laurels. They
failed to create a .VXD architecture based client for Windows,
overconfident in the believe the consumer wouldn't mind running the
legacy .386 architecture client. The same thing happened to After Dark,
which failed to rewrite their 16-bit code. This was not Microsofts
fault.

> And M$ often buys technology, that's not news. Nor does it have anything to do with
> their having a monopoly in Office Suite or on Desktops.

But it does have to do with the misconception that they have "inside
knowledge," when there are many people with inside knowledge to the
Windows OS.

> Did you notice what happened to Stacker? Or After Dark? Products that aren't sold, in
> part, because M$ bought such technology and incorporated into their software, so
> consumers didn't need to buy and so didn't buy such products.

Stacker was a dangerous product, as is any disk compression that is
filesystem based. They became irrelevant because HDD's became cheap. I
don't even USE compression on my drives, do you? After Dark was a legacy
application that insisted the consumer should be satisfied with a 16 bit
application in their 32 bit OS.

> See, that's a real problem. If you get M$ Office for free, why would you buy
> WordPerfect? If you get a screen saver for free, why buy After Dark? If you get a
> browser for free, why buy one?

So the government should side with the small businesses over the
consumer? By that logic I suppose the government should ban TV news to
protect the newspapers which you must purchase.

Anyway *NOONE* gets MS Office for free, you might recieve it bundled
with a computer. but it's included in the price of the computer, it's
NOT free.

You don't think someone will buy a product just because they have one
that's free already? Why would anyone buy Windows then? Or the
newsreader I'm using now when I already have the MS one? When there is a
BETTER product, people will buy it.

This decision is best left to the consumer.

> Andy please elucidate on _WHAT_ sucks in Red Hat?

Everything. The entire user experience from start to finish. A few notable points:

The installer *still* complains if you try and put a boot partition above 1024 cylinders and absolutely refuses to allow you to continue (unless you go with it's suggested partition arrangement in which case it just suggests that you don't do that[1]) despite being perfectly capable.

The hardware detection is pathetic compared to other distros. Even simple things like making some use of the Windows key which is on almost all keyboards these days isn't done for you.

The configuration tools are scattered all over the place, all work differently and most are quite counter-inituitive. The auto-update is rubbish compared with the Mandrake equivalent, requiring you to faff around with their website[2] and send them all the sorts of details that everyone was worried Microsoft would want from you when they thought up Windows Update.

Need I continue?

AndyC

[1] And what the f*ck is the point in "recommending" a partition arrangement if you are then going to announce that it isn't recommended.
[2] Which, stupidly enough, only seems to work properly in Internet Explorer under Windows.

Indeed. Of course the trouble with the Linux community is that they just
aren't devious enough. They should've taken Kerberos, added their own
proprietary extensions and then released them under the GPL.

Hmmm, where's my compiler gone...

Hi Rory,
thanks for that info. Great if I can run my good old ST programms also on
Windows2000 now. I read that Gemulator even can emulate the blitter and all that.
Lovely.

Hello,

Does anyone know where I can get a case +power supply unit for an atari st
520 fm please.

Cheers,
Andrew Emberson.

>A monopoly means the consumer has no choice.

Not in the real world.

A choice can still be available when a company is monopolistic - like Microsoft, for instance. And most users *didn't* get a choice, because of the licensing agreements with major PC manufacturers which is how a lot of people buy hardware.

I got my RAM from Wiiztronics. They sell a Memory card that takes 72pin simms. It works great. They also sell a 16Mb simm as well. For prices, go to www.wizztronics.com

Joshua.

You can get the PSU from Atari Workshop http://www.atari-workshop.co.uk, but they are very expensive, 50 UKP. For 50UKP you get a complete second hand ST, often with extra hardware and software.

Take care,
Daniel Hedberg

I didn't mean to say that you *had* to have old hardware, but I guess it
came out that way. What I meant was that if you have a PC that was
built with no consideration for Linux, you can't reasonably expect all
you peripherals to be fully supported should you decide to install Linux
on it, if the peripherals are relatively new (not the actual cards, but
the chipsets or firmware used).

Yes, I read the comment pretty much as "no new hardware is supported
by Linux; the support comes only later if at all" ;)

It seems to depend quite a lot about the manufacturer; eg. nVidia and
3Com seem to have rather quick support for Linux, whereas some
companies seem to be a real pain in the ass with support lagging years
or infinitely.

I have some more Falcon do-dads to sell:

$10 RGB video adapter (Atari made)
$10 Composite video adapter (from B&C computer visions)
Video only, this does not bring the sound out with the video
$15 Internal 2.5" drive mounting kit (braket+screws+cable)
$30 ScreenBlaster II (hardware+software)

$3 s&h anywhere in the USA

Please respond to my mailbox (see below) if you have any questions.
I do not read this section. Thanks.

Source record: 42949
Cross-posted to: alt.amiga,comp.sys.amiga.advocacy,comp.sys.amstrad.8bit,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.cbm,comp.sys.sinclair

Why buy a $300 NEW computer when for that amount of money you could get a very good USED computer? If you added an office suite, a VGA monitor connector and a printer to the Sega Dreamcast (which already has a browser, modem and keyboard available), there's a cheap combo with great games!

A decade from now $300 may be the standard price for a computer with relatively new technology, but the price today is more like $800-1000.

Realistically, you would have to be able to produce a $300 machine for about $50-70 to count in all the other costs, like shipping and returns, so someone would have to think outside the box, so to speak, to get the job done.

I do NOT think a monitor should be included with it. It adds weight and cost. You go to a thrift store and there are lots of monitors there. People also have TVs. The computer should have connections for at least types of monitors: SVGA, RCA and AV for TV/VCR. People can get whatever type of monitor they want.

I also think the day of the all-in-one desktop unit (the Apple IIc, Atari 800, Commodore 64 etc.) should be revived if one wants to be economical. Have a serial printer port, joystick/mouse port, the aforementioned three monitor/TV ports, SCSI port. Built in would be a 33k modem and 3.5 floppy drive for data storage. I wouldn't include CD-Rom. All the necessary stuff should be pre-installed to make life easy.

There would have to be a GUI. Something tight that doesn't slow down the new user. HD let's peg at 1GB and Ram at 64MB and figure the processor is 333 MHZ -- good enought to make the Net move but cheap by today's standards. The builder should work a deal with Lotus or WordPerfect to put a low-priced office suite on here.

These $300 machine won't compete speedwise with their $800 counterparts, but are GOOD ENOUGH for most users. And as the $800 machines get faster/better, so will the $300 machines due to trickle-down technology. Perhaps they will be five years behind the more expensive machines in bits and bytes.

That's my biz plan.

I'm looking to bring my Falcon to my office and network it with a PC. I want to share the internet connection with it. I want to use wingate or similar on the PC end and use serial connection for it. Few questions:

What kind of serial cable should I use? Is there a limit on lenght?
How do I setup STiNG on the Falcon end?
How do I setup Wingate?

Thanks.

Joshua.

> underlying MiNT threads. I have no idea if it can be done, just
> an idea...

It can be done, I suppose. But if I do, it will encourage the described usage. :-)

The correct usage is:
If you want to start a thread, fork.
Each thread must issue its own appl_init.
Thats all.
Of course you are yourself responsible for guarding integrity of memory used.
So give each thread its own resource file, and of course its own parameter area's.
There is absolutely no need for passing a global area to every AES call.
And even then, I would have designed the use of a handle. But as I said, not needed.
The pid under which you issue the AES call is good enough. :-)

PS:
I havnt tried it yet. :-) But this is how it should (and ever will) work.

Hi everybody

I have problems with my providers news server.

I dont get all the news there is.
This is a general problem of Chello (UPC)

Please, if you dont see a reply from me, where one should certainly
be expected, forward the news article to my private mailbox.

A future version of XaAES will come with binding libraries that
keep ALL parameter areas on the stack.
There will be 2 appl_init bindings.
One like the old, one with a extra parameter to be able to supply
a global area. This will be used throughout.

I believe ST Format Disks are readable on a PC. If not Ghostlink and
PARCP are programs that will do it, but you need a Null modem cable for
Ghostlink and a special cable for the other program.

You need a program like Extendos Gold for the CD ROM. I have what you
have plus Extendos and it allows my STe to run a CD ROM drive.

:) We're talking about Microsoft, and you can use Microsoft as your
example of precidence? "Microsoft can be a monopololy even though there
are choices, take Microsoft for instance?"

> And most users *didn't* get a choice, because
> of the licensing agreements with major PC manufacturers which is how a
> lot of people buy hardware.

They chose to buy a PC with Windows on it, they had a choice. If anyone
here can find me a PC they want, and they don't want Windows on it, I
guarantee I can find it somewhere else, with the same warranty, support,
and hardware, at the same price, with another OS on it.

Even during the time when Microsoft had exclusive licensing clauses
(ended around 1993) there were options. I mean, heck, look at this
newsgroup.

Do you really think that everyone with windows on their computer was
forced to use it? I guarantee if you take a poll and ask people buying
new machines, and ask them what OS they want on their new PC, it will be
Windows. The people who want something else will buy a machine without
Windows. (Personally I've never purchased Windows, but I get developer
versions via MSDN, and beta versions like the XP I'm using now)

Here's the real world situation. Microsoft can't touch Apache with IIS
in any of it's incarnations, and it doesn't look like that will change,

despite the fact they'll give it to you FREE with Server, and Mindcraft say's it's faster and scales better.
On top of that, after stating "opensource is a virus" Microsoft has egg on their face because they just cant for the life of them get hotmail to work without good old BSD holding the fort, and this is at a time when they're pimping their platform for .Net.
There are Free alternatives to all of Microsoft's products, and ones in developement for products Microsoft hasn't even released yet! Miguel's already pimpin' Mono to work with .Net.
Microsoft's days are numbered, they see the writing on the wall, they know they can't compete with a competitor that they can't buy, undersell, influence, or lock out of the market. The government stepping in right now, would just stop the inertia at a time when they're not needed anyway, they'd take the credit for the inevitable.

Monopoly or not aside, the governments role is to protect the consumer and ensure the consumer has choice. The government's role is NOT to leverage consumer choice for the benefit of Microsoft's competitors. If competitors are cutting each others throats giving away free software, and as the dust settles, the consumer has free software, and netscape's dead, the consumer has benefitted. What then, would the consumer benefit from the government flexing its arms at Microsoft on behalf of these businesses who lost the war to the benefit of the consumer? That's supposed to be how the Monopoly law works, to benefit, for, and ONLY, the consumer.

So where has the consumer lost? The consumer has both Netscape, AND IE, both free, and without the government stepping in where it would have hurt the consumer to do so.

The fact remains, Netscape is just as available as it's always been, if not more so. From the consumers point of view, the consumer has won. From Netscapes point of view, they are legally entitled to financial damages, but they are NOT entitled to having the customers choice overruled by the government on Netscapes behalf.

This isn't really anything more than a political issue I believe, I think this discussion is between the chairs on the left and the chairs on the right. :)

Hi Peter,
That's a good point. IIRC one of the main selling points of Positive Image was that it held the full picture data in memory and displayed the dithered result on screen. When an option was applied to the image, it was applied to the full data in memory rather than just the dithered version on screen in the colour depth you were running. As such, the saved file would be the best that could be expected.

By implication, if you do a "Save As" of the amended file in LookNSee, then it will save the screen version as best it can. So, if it's a 24-bit image displayed on a 16-bit screen and saved as a 70% JPG it will have degraded quite considerably.

I know that Imagecopy does this. I asked Jeremy the best way to crop a Jpeg and he advised running in the highest colour depth possible first...

> Haven't played with Positive Image yet, though I have V2.

I only remember getting half way through v1 here, so yours should be better equipped than mine.

> With Imagecopy, as I said elsewhere, do the Options\Screen\Colours
> affect saving as well? I thought it was just the screen, and having
> just tried it for Convert, the sliders seem to have no effect.

Saving affects the displayed image, so yes to the first part.
Convert didn't work for me either (I'm running v4.22 here - can't remember the last/final version).

> Or do you mean I should make a new screen grab with the lightened
> image? In that case I only have 32k colours available on my RGB
> monitor, but that should do in this case.

Yes, unfortunately. If 15-bit is the highest you've got then you shouldn't notice the deterioration too much, but it depends on what colour depth your friend had access to. Have a quick go in PI2 first, for the reasons I stated above. It may also be that by modifying the

image in a higher colour depth, the loss involved in resaving as a JPG may not matter so much.

Btw, what other save/load formats are available to your friend? TIF or PNG would bump up the filesize, but avoid the lossiness...

Rather than registering what you've got in just one week of the year, announcements of successful registraions by users at any time - part bragging, part information - could keep people aware of what software is newly available and which authors are still responding to user-contacts.

> Some have taken the money and run, leaving behind unsupported buggy
> translation software.

I wish people would stop going on about this. If shareware is "try before you buy", then paying up is paying for what you've already got. There's a good element of expecting a further response from your support, and a fair chance too, but it's not a guarantee.

> Other gem's i'd happily re-register for an upgrade have sunk into
> the programming dark beyond.

Sure - re-registration is a bit hopeful...

> Maybe anyone who considers taking up this suggestion should post

>I think you are missing the point.

Not at all. The "point" was to try to make a "new" computer for $300.

MY point is that NO ONE WILL BUY ONE if it has half the features and
runs at one tenth the speed of a comparably priced system ALREADY on
the market.

> Rolls Royce still make cars to a standard
>not to a price. Kit cars (usually VW based) are still available.

And Rolls Royce has been in financial trouble for quite a while now.

And "kit cars" cost a ton of money, and hardly ever work right.

You can ride to the Space Station if you have enough millions.

But can you build an obsolete hackers' computer for only $300?

> I think a "kit
>computer" is a nice niche idea. I certainly subscribe to the idea behind it.

Certainly, you can find something to fill almost any niche, if price
is no object.

I always lusted after a KIM-1, even though it cost more than our $300
price point, and did very little. Want to guess how many were
actually sold?

>He added that it will drive a CD-ROM drive, but only at the most basic
>level (i.e. reading data), but probably not stuff like extracting audio
>data, control of audio CDs, accessing specific sessions of multi-session
>CDs etc.

It should be capable of doing some very basic control of the drive,
enough to play the audio tracks, but couldn't get it to extract audio
tracks or access multi-session CDs. The latter was a pain as I burnt a
couple of CDs with all my ST software, in 2 or 3 sessions, and it could
only handle the first session.

I'm not sure if this was a software or hardware limitation since I don't
know if the drive could read multi-session discs, or if it was a
limitation imposed by Spin or the adapter. Since I no longer have an ST,
nor the CD to test it, I can't check to see just what was the
limitation.

Regards,
David Bolt

2500. Want a copy of : Zap! The rise and fall of Atari

Newsgroup: comp.sys.atari.st
Date: 2001-07-31 03:51:51 UTC
From: Jeff Thomas <atari_st@bellsouth.net>
Message-ID: <IRp97.1944$jL6.280253@e3500-atl1.usenetserver.com>
Source record: 42969

For the last year, I have been looking for a copy of the book: Zap! The rise and fall of Atari by Scott Cohen. It has been almost impossible to find....until two weeks ago. I was on Amazon.com and found two used copies....yes...but they wanted 97.50 and 172.50 for them. I want the book.....but not that bad. Well...to cut the story short, I found this Web site that will make you a copy of the book...yes..they actually make it when you order it...for $16 bucks. Keep in mind, its not the original...but a copy of the book. The girl I talked to there said that they have agreements with authors to re-publish their work...without the author having to invest thousands of dollars to have multiple copies made. She said that they make the book when a customer orders one. I assume that Scott realized there still was a demand for this book.....so he used this firm to get it back in the market. Get your copy today!!!

2501. SyQuest EZ-135 Drive

Newsgroup: comp.sys.atari.st
Date: 2001-07-31 04:07:45 UTC
From: dwolfe@netcentraltv.com
Message-ID: <9k5aufmon1@news.chatlink.com>
Source record: 42970

Saturday the EZ-135 drive didn't want to spin up to lock-up, after a few attempts it came on line but would access files and programs very very slow. the next time I wanted to use it, it would not work the green power light wouldn't come on, so I think it is the transformer that is going out ??

The transformer plug to the drive has 3 pins, the receiving plug on the drive only uses 2 pins a red wire and a black wire. So I will call pin-1 the red-wire & pin-2 the black-wire & pin-3 unused.

Between pin-1 & pin-2 there is no voltage, but between pin-1 & pin-3 (unused) my meter reads 12 volts. My question is can I move the black wire from pin-2 (no-power) to pin-3 12 volts of power ?? On the transformer information label it list the output as 5v---1amp??

Or should I try to find a new power supply, which could be a chore since SyQuest is out of business....

Regards, Donner.....

2502. JAM 8 with SoundPool FDI?

Newsgroup: comp.sys.atari.st
Date: 2001-07-31 04:17:22 UTC
From: nurmix@spam-free.com
Message-ID: <3b66301e.6462109@news-server.socal.rr.com>
Source record: 42971

I've been looking for an Analog 8 (and posted here recently about it). Someone has offered to sell me the Jam Pro 8 out. I know that Janka Gerhard mentioned problems interconnecting SoudPool and Line Audio devices. Does anyone here know if I'd be able to connect my SoundPool/Steinberg FDI to the JAM 8? The FDI only has a single port, so the JAM 8 would have to have a through port. Unfortunately, I don't know much about the JAM 8. Any help or information would be appreciated.

Well the users have always had a choice, simply to drop the
OEM version of Windows and pay extra for the retail version.
The vendors and dealers were just never any good at informing
the consumers.

Who are to blame, really?

Regards...

I think if you take a poll on new PC owners they would not know what an OS was you would be more likely to get the answer Word.
As far as experienced PC owners, what non-commercial OS are they going to ask for? I mean Really, Red-hat is not yet buying ad space in Time, newsweek, or insert-your-favorite-non-Linux-publication-here.

> Here's the real world situation. Microsoft can't touch Apache with IIS

They seem to be doing a pretty good job, and 'Code Red' virus seems to be proving it. But with several companies buying into the 'technology partner' status, and '.net' strategy, it seems to be Microsoft || die.

> On top of that, after stating "opensource is a virus" Microsoft has egg

Last time I checked(recently), hotmail was running windows 2000 on IIS. Yeah shocked me too. I was doublechecking it for accuracy and according to the website I used(I think it was netcraft) they were no longer FreeBSD. Which the NT-vs-Linux.org site needs to be updated cause that is the link I _was_ referencing in conversations.

> the consumer.
>
See comment about Geos above. When I was consulting, 10 years ago, Geos was considered by some to be "better" than windows. For 3.10 that was not a huge challenge. But it's dead now and the company's only claim to fame is a (silly)patent on WAP. Is the consumer protected by geos' inexistance? Was Microsoft the first company to produce a software product called internet explorer? what happened to that company?
Was the lesson of geos, and the company who originally owned the copyright to the name to "internet explorer" as a program a benefit to the consumer?

> So where has the consumer lost? The consumer has both Netscape, AND IE,

It wasn't that MSIE was free, it was that you couldn't get windows without it. It would be like firestone striking a deal with Ford that you couldn't get a shiny new (ford)SUV without firestone tires on it.

> This isn't really anything more than a political issue I believe, I
> think this discussion is between the chairs on the left and the chairs

I guess you must be sitting on the right, because I know I am on the left. oddly enough I am a Microsoft user, but only the OS. You see I bought the OS because it came preinstalled on my machine before I knew about your gaurantee. I don't have the office suite because I don't have the $450 to buy the non-upgrade copy. (oddly enough though the Corel office competing product is only $100, why is that?) I am writing this from a Linux box on a telnet session because the emulation is better.<rant /> Matt

2505. Re: SyQuest EZ-135 Drive

Newsgroup: comp.sys.atari.st

Not recommended. Supplying too high a voltage is a good way to kill
semiconductors.

>On the transformer information label it list the output as 5v---1amp??

The case of my supply gives an output of 5v at 3A. Maybe my drive used
the 5v to drive the spindle as well as the rest of the electronics while
yours uses 12v for the spindle and 5v for the electronics.

>Or should I try to find a new power supply, which could be a chore
>since SyQuest is out of business....

Depending on how you feel about it, you can rip the drive mechanism out
of the case and plug it into an AT power supply and it should work fine.
If you do use an external supply, it's got to be an AT type unless
someone's figured out how to use an ATX supply.

This is what I ended up doing when PSU for my EZ-135 died. It was like
that for some time, along with the CD and 2 fixed drives and worked
well.

Regards,
David Bolt

The latest (and last) version is 0.37. Note that SPIN! is not Freeware
but Fairware (or something like this), which is some kind of Shareware.
So if you are using SPIN! regularly you have to register and pay a small
fee, regardless of whether you have the version from the web site or
another version.

Bob Retelle (bobr1@provide.net) wrote:
: MY point is that NO ONE WILL BUY ONE if it has half the features and
: runs at one tenth the speed of a comparably priced system ALREADY on
: the market.

Bob, you are missing the point. The point is to play with an idea. The underlying question is: if we could create our own computer, how would be build it? The price point is there so that we don't build something, like a quad processor Pentium IV, or what be it.

It does not matter whether this machine will sell, because it is only an idea. Sometimes ideas are good, and sometimes ideas are bad. There is no sole judge of quality and, if there were, it certainly wouldn't be on marketability. In this day in age, the Apple II, Amstrad, Amiga, and Atari have very limited markets. That does not mean that these machines were bad ideas. It certainly does not mean that we who use them have bad ideas.

And even if sales were an issue, I'm sick and tired of this damn "you must own the market to be successful" mentality. To pick on Commodore and Atari: these companies were split up, sold off, and bought by other firms. Does that mean that the Amiga or Atari ST were unsuccessful. Apple's marketshare is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that Apple is a failure? Apple is almost 25 years old. Is Sun a failure, by the same logic? Of course not. It is absurd. If I can make a living while serving a few hundred clients, I would consider myself a success. If I could do that with my 68k proposal. And, as I pointed out, similar machines which are targeted to a limited market already exist in the sub-$300 price range.

Yes, 68k and Z80 based computers are still made. A tenth of the power? Heck, I'll bet that the 68000 is a lot slower than that. Ditto for the Z80 based machines.

The point is: these machines are not targeted at the same market that Windows, or MacOS, or any other entertainment/office platform is targeted at. The TI-89 is designed as a calculator, and the design is directed towards portability and the entry of mathematical expressions. But don't be fooled, this is a computer as powerful as an Atari ST. It is routinely programmed to serve other purposes (assembly, C cross compilers, etc.).

Does TI sell millions of '89s every year? That is doubtful. They offer about a half a dozen different models (again, some are Z80 based and are just as programmable). HP is probably their biggest competitor, in a similarly small market -- and there are others. Are any of these companies

or product lines a failure as a result.

If you want to by your dime-a-million VCR's and Wintel computers, be my guest. If you think that our discussions are illconceived, so be it. But if you are more interested in tearing our designs apart than contributing construtively, I suggest you shut your mouth, add this thread to your kill file, and forget this little band of crazies exist.

Good night, and thanks for puting me in a foul mood,
Byron.

This is a limitation of the adapter, which does not support high SCSI command classes to be used. This results in, as already said, only a subset of SCSI commands being available.
ICD compatible adapters like the original ICD adapters or the LINK96/97 provide means for using any SCSI command, provided your driver supports this. In the case of SPIN! the SCSI driver has to provide this capability and this is the case for the SCSI drivers of CBHD and HDDRIVER.

Actually, I don't think Microsoft had anything to do with it, Commodore
couldn't market pardons in prison. They had a bad habit of marketing to
customers they already had, or "preaching to the choir."

> > Do you really think that everyone with windows on their computer

;)

Most of our customers ask for Windows 2000, thinking it's 98's next
version. Then they ask about the Millenium version, so we tell them that
it's WinME they're thinking of. The ones who don't ask about the OS just
assume that Windows "comes with" their computer, they also assume
MSOffice comes with it also.
Then we hit them with the price. Win98/ME $99 installed, Linux, your
choice of distro, $50 installed.
Some ask, "what do you mean installed?", We respond, "that means we
install it" (as if the HDD was manufactured with an OS on it, sheesh).
"But Gateway doesn't charge for that!", "Yes they do, it's built into
the price they're charging you for the OS, we're not charging you extra,
we're giving you the option of not paying for something you may not
want"

> As far as experienced PC owners, what non-commercial OS are they going to
> ask for? I mean Really, Red-hat is not yet buying ad space in Time,
> newsweek, or insert-your-favorite-non-Linux-publication-here.

Red Hat /is/ a commercial OS, and an "expierenced PC owner" has I'm sure
been flooded with information and hype et al about linux, including from
such sources as... Time, Newsweek, insert just about any major PC
magazine here. In fact, didn't Time do a huge article about Linus and
name him one of the "people to watch" right under (or was it above) Bill

Gates?

> > Here's the real world situation. Microsoft can't touch Apache with IIS

;) I don't know if we can look at virus proliferation as a sign of
Microsoft dominance, but it's a funny thought. ;)
I remember several people talking about the P3-unique ID the way some
talk about .net. We'll see how many die from lack of .net.

> > On top of that, after stating "opensource is a virus" Microsoft has egg

If you used Netcraft to check their servers, you were seeing a straw
man. You'll notice a few weeks ago netcraft identifies them sometimes as
"BSD" sometimes as "2000" and I even saw a "???" listed, MS is playing
games putting an "airgap firewall" up. (which by the way, is actually
good security practice, my firewall is linux, but it reports itself as
NT4 :) It's harder to hack if you don't know what you're hacking)
But Microsoft has recently stated that they were using BSD, and that
the transition would be gradual so as not to effect the user. This has
been going on for a while now.

> twice as good to unseat you.

You don't have to unseat Microsoft, and they don't have to die, they
will simply become less relevant over time, Like the term "Word Doc" is
less relevant now, since like Kleenex, many Word Processors can save to
Word Document format. Sometimes common usage is a bad thing for the
trademark holder, it can be a sign of evaporating relevance.

Geos still exists. They simply renamed themselves "New Deal Office" and
are marketed at Doorstop-technology machines, like old 486's. They
wern't squeezed out of the market, they chose a niche, that they are
currently filling.

> Was Microsoft the first company to produce a software product called
> internet explorer? what happened to that company?

They sold their rights.

> Was the lesson of geos, and the company who originally owned the
> copyright to the name to "internet explorer" as a program a benefit to the
> consumer?

Considering the consumer gets it free? How is that not a benefit? The
consumer also gets the competitors product free also. I can't think of a
way that the consumer has lost, can you? And guess what? there's more!
If you have a hankering for something different, there's Arachne for DOS
(free) and Opera for Windows, get this, selling their browser, in spite
of Netscape and IE being free. You know why, they built a browser that
suits the needs of some people who are willing to buy it where as the
free ones didn't. (actually tried Opera, didn't like the MDI-windowed
interface, but it was fast!)

I hate to break it to the Netscape people, but netscape was a pain in
the ass quite often, up untill V6 anyway, 6 looks good. (Why couldn't
Mozilla use 6's interface instead of that legacy 4.7 crap?)

> > So where has the consumer lost? The consumer has both Netscape, AND IE,
> > both free, and without the government stepping in where it would have
> > hurt the consumer to do so.
> >

> Without AOL would netscape 6 even exist?

Probably not, or at least it wouldn't be as good as it is now. The same, however, can be said for IE. Would IE exist, as it does now, if not for Microsoft?

> > The fact remains, Netscape is just as available as it's always been, if

But if they decided to give you the tires for free, to keep, and you had the choice to take that money and buy your own tires, in addition to keeping the firestones, well,hey!

> buy the non-upgrade copy. (oddly enough though the Corel office competing
> product is only $100, why is that?)

Demand.

You should have bought the PC from someone who could have sold you an OEM MSOffice. (well, assuming you bought them at the same time anyway)

Here's a tidbit, we make more selling Correl Office Suite than we do MS Office. Last time I ordered Corel (OEM version mind you, but the whole Office Suite) it was $14 my cost, we sell it for $95 installed, with correl Office ServicePack3 patched and all. Should be a National Average price, since I had to get it from Ingram Micro.

> I am writing this from a Linux box on
> a telnet session because the emulation is better.<rant /> Matt

Writing this from Microplanet Gravity on WinXP RC12505 (gettin RC2 tommorrow!) Microsoft's newsreaders suck. It's worth the price for

Gravity. (I just didn't care for Agent, it felt like a 16bit app, just me?)

And where, pray tell, would you get, for example, a Dell Precision
(complete with cool case, quirky motherboard arrangement and proprietary
power supply) preloaded with QNX?

Or did you mean "I can find something a bit like it somewhere else"?

I think the biggest reason for this is that most of the people (not the technogeeks like most of us here in these newsgroups) simply don't know about the alternatives. Your average computer user will most likely get their new overpriced system at one of the big retail chains such as Circuit City, or Fred Meyer, or whatever. When they walk into one of those places and look over the selections, they will see the stats on the display models, and it will most likely list some form of Windows, some form of MS-Office, and probably a trial subscription to MSN or AOHell (in addition to listing the hardware of course). At those mass-market chains, you never see systems with stats placards boasting Linux and Star-Office. And the sales rep most likely won't even consider mentioning those as a possibility (if he even knows what Linux is).

As an example, only about 2 years ago, I was at the Base Exchange at McChord AFB, and was looking over the different computers in their electronics department. I asked the sales rep there if I would be able to buy one of their systems without any OS installed, since I was scouting out a system to become a Linux box). He just flat out refused. I don't remember the reason he gave, but if I wanted one of their computers for my Linux system, I would have to get it with Windows-98 preinstalled, which I wouldn't have been using anyway, so why would I want to pay extra for it?), reformat, and then do my Linux install.

So, to cut this post short, since I nearly lost my train of thought here... What good is having choices in operating systems and other software packages, if the typical consumer doesn't know about those choices and the folks selling the systems won't volunteer that information?

Does anyone here remember Don Turnock and Megatype Software? They had fonts for
Calamus and Pagestream. In addition they were somehow involved with
Type 1 Convertor which would take Postscript font files and convert them
to Calamus format.

Does anyone have an email address for Don?

Thanks.

>Bob, you are missing the point.

Actually that's not entirely true.

This thread has split into several directions from the original question of what a $300 "home computer" would look like.

Some of the threads I've stayed out of, since I really don't have any experience with the esoteric CPUs that have been proposed (other than knowing that they ARE esoteric).

Other threads have pointed out that successful, well appointed $300 computers already do exist, with no necessity of leaving out CD-ROM drives or I/O ports as the original post suggested. Those I've participated in, my response was one of the first ones actually, with the comment that I just bought a very nice, new PC for less than the suggested $300 price point, with nothing left out to cut corners.

More threads have questioned what the potential market for the proposed new system would be. This is where my questions about the marketability of a system like this have fallen. Unless the proposed audience is only the handful of people participating in this discussion, then the question of the market for any product has to be addressed.

(Yes, I know this is all hypothetical, but it's still a valid question)

> The point is to play with an idea. The
>underlying question is: if we could create our own computer, how would be
>build it? The price point is there so that we don't build something, like
>a quad processor Pentium IV, or what be it.
>

Oh, I'm very familiar with the idea of kicking around concepts- the question comes up on a regular basis in the Atari newsgroups. It's

usually phrased something like "What CPU would you like to see in a new Atari ST clone?" And it goes back and forth, much like a lot of this discussion has, with no one really ever believing it really could happen, but it's just fun to talk about.

>It does not matter whether this machine will sell, because it is only an
>idea. Sometimes ideas are good, and sometimes ideas are bad. There is no
>sole judge of quality and, if there were, it certainly wouldn't be on
>marketability.

Well, the original post presented the idea with a definite slant toward the marketability question.

Why propose leaving out such features as a CD-ROM drive to cut corners down to the $300 point if marketability wasn't an issue?

The original question was presented as if a new "hackers" computer might be a viable product, if only the cost could be contained to a reasonable level, similar to the "good old" machines we used to tinker with.

>In this day in age, the Apple II, Amstrad, Amiga, and Atari
>have very limited markets.

I would say they have ZERO market, but there are those among us who might get upset at that.

People still buy wax cylinders for Edison phonographs but that doesn't mean there's a viable market for them.

>That does not mean that these machines were bad
>ideas. It certainly does not mean that we who use them have bad ideas.
>

Definitely not. The current situation (for anything) doesn't change the history attached to anything.

The Apple computer was groundbreaking. It brought commercial success to the brand new microcomputer world truly for the first time. All the earlier attempts were close, but no cigar.

Atari was the most technologically advanced computer of its time. It's coprocessor chip set was far and away better than anything available when it came out. The fact that Atari, Inc, and Atari Corp couldn't figure out what to do with it doesn't take anything away from the computer itself.

The Commodore 64 was THE most successful microcomputer of ITS day. It was the best selling computer in the entire world, at that time.

The TRS-80 was a solid, well marketed system. It was headed in the right direction with its business applications. You could buy one in a million Radio Shacks.

All of these were good ideas, at the time.

You'd have to be crazy to try to sell any one of them now.

>And even if sales were an issue, I'm sick and tired of this damn "you must
>own the market to be successful" mentality.

"Owning the market" is an unusual situation. Generally there are
several competitors, each with its own market share.

The auto industry has many players, but they all provide a
"standardized platform". When you buy a car, you get the same four
wheels, the same steering configuration, much the same control
mechanism. There are variations, of course, but the basic product is
built around a standardized platform.

The computer industry has standardized on a platform as well.

> To pick on Commodore and Atari:
>these companies were split up, sold off, and bought by other firms. Does
>that mean that the Amiga or Atari ST were unsuccessful.

Those are not the reasons why the Amiga and ST were unsuccessful, they
are the result of the products being unsuccessful. The companies
might have survived if the products had been successful and had sold
well.

> Apple's marketshare
>is nowhere near 10% (let alone the 90% claimed for M$). Does that mean that
>Apple is a failure? Apple is almost 25 years old.

That makes Apple far more of a success than any of the other companies
mentioned. Those other companies are all dead.

Simply by surviving for 25 years, Apple has succeeded.

Apple does that by selling products people want to buy. They've had
failures, sure, but they generally learn from them and bring out other
products that are more successful.

> Is Sun a failure, by the
>same logic? Of course not.

Sun has a very good position in its chosen marketplace. It too sells
products people want to buy for their specialized needs. In that
respect, Sun is very successful in its market.

> It is absurd. If I can make a living while

>just as programmable). HP is probably their biggest competitor, in a
>similarly small market -- and there are others. Are any of these companies
>or product lines a failure as a result.

The definition of success or failure depends on many things.
Obviously both TI and HP consider some of their products to be
successful since they continue to sell them and to introduce more
models. Other products are dropped from the product mix.

One thing you can be sure of though, if no one bought a TI calculator
model, it wouldn't last long in the marketplace.

It wouldn't matter what features it had, or what CPU it was running,
or how loyal the people who might have bought one felt about it. If
it didn't sell, it would be dropped.

And they certainly wouldn't introduce a new model unless they felt it
WOULD sell, and they had researched the marketplace to be sure.

My questions about the intended market for the "$300 Hackers'
Computer" are along the same lines.
>
>If you want to by your dime-a-million VCR's and Wintel computers, be my
>guest. If you think that our discussions are illconceived, so be it. But
>if you are more interested in tearing our designs apart than contributing
>construtively, I suggest you shut your mouth, add this thread to your kill
>file, and forget this little band of crazies exist.

Like I said, discussions like this can be interesting and can expose a
lot of people to concepts they might not have thought of otherwise.

But part of discussing what might make a successful new computer has
to be a discussion of what made earlier attempts fail.

As much as I loved my Atari 800, I know why it disappeared from the
stores, and why my Commodore 64 fell from being the most successful
computer in the world to a $5 thrift store white elephant. And, I
know why the other computers I have now have succeeded.

>
>Good night, and thanks for puting me in a foul mood,
>Byron.

Sorry about that- unfortunately that's sometimes part of being
"devil's advocate".

> actually sold?

Getting even farther from the original topic. It is quite easy to have
a "kit" computer for next to nothing. Here's my current little kit
project...

http://www.oz.net/~otter/gallery/Thissle.JPG

This is eventually going to be a dual-boot Linux/Winblows-98 beast.
Here is what Thissle currently has:

ISA/PCI motherboard
Intel Pentium-120 CPU (Socket-7)
40 MB RAM (72 pin SIMMs - 4 8MB SIMMS and 2 4MB SIMMs)
256K Cache
Hard Drives:
IDE x4 Quantum Fireball ST3.2 3.2GB
Western Digital AC-2850H 850MB
Maxtor 71260AT 1.2GB
Fujitsu M1636TAU 1.2GB

SCSI Quantum ProDrive LP240S 245MB

CD-ROM Chinon CDS-53S
Colorado-250 Tape Backup Unit
Standard 3.5" HD Floppy Drive
Trident TGUI-9680 PCI Video Card - 2MB
56K Modem - ISA

AMD AM-2100 NIC Card - ISA
Adaptec AHA-152- SCSI Card - ISA
SB-16 PnP - ISA
Nice SVGA PnP monitor
Typical 2 Serial Ports and 1 Parallel Port
She still has 2 empty PCI Slots

Right now, I'm just messing around with her Win-98 side, mostly for hardware testing, and for teaching myself networking. The Network hub sitting next to her will be used to link her and SunBlossom (the P-166 system I'm posting this from) together, as soon as I find the documentation for the hub.

All total, I think I have at the most $25 to $30 invested in her. The majority of her components were given to me from friends and co-workers who know I like this old stuff, with the rest being purchased from thrift stores.

I think this definitely qualifies as a "kit" computer, or at least as a "geek station". :) She's got enough to be operational, with plenty of room for upgrades and expansion as super cheap components become available.

Now as for the original question that started this whole thread...I'll have to think on that. Should make good bathtime thinking material later today; or goo drifting off to sleep thinking fodder. On that note, it's time for me to get some sleep.

Night all.

> BobR
>

Maybe I should have left more context in, because I'm trying to figure out your implication.

My recollection was that the KIM-1 was a popular computer, though at a time when popular didn't have to mean a large quantity. At the time it was sold, it was still early in the cycle of small computers. People were still wanting computers because they had always wanted a computer (something a few years before was an impossibility for most), rather than because they had a need to do something with a computer. So the low cost, for the time, was to many more significant than the fact that it lacked memory, etc. In fact, the KIM-1 wasn't all that limited for the time, remember the Altair came with something liek 256 bytes of memory. To get a computer "that did something" you'd have to spend considerably more.

And of course, some people took their KIM-1's and made them into full-blown systems, with video boards or dumb terminals, 32K of memory, disk drives, and all kinds of things.

I have a KIM-1, got it in 1979 (late for the time, but clearly way before most people got computers), so I'm biased. But my impression is that the KIM-1 was an influential system, coming between the S-100 systems that started it all, and the all in ones that came in 1977, like the Apple and the Radio Shack.

And now I'm really curious about your impression of how many KIM-1's were sold.

Michael

Hi,
The JAM8 has a thru-port - actually, the male connector has a female
connector soldered directly on it, so there's no problem connecting it to an
S/Pdif.
The only problem that's known to me, is with the JAM-IN boxes - where you
don't get the correct clock if you don't connect a DAT to the S/Pdif - but
Line Audio Design has a solution for that, with a modification in the
S/Pdif.

Hi, I was just wondering if there is any free software for my Falcon that enhances the resolution displayed on my sm124 monitor? I tried "videl inside" but found it very unintuitive,
does someone perhaps know what settings to use? I want a larger screenarea in Cubase.

best regards

Anders Gï¿½rder

Ok, does it make any difference (as far as connectors are concerned)
that it is the JAM 8 Pro (rackmount version)? I assume you are
referring to the "table top" version of the JAM 8 above.

Hello,

I posted a message talking about my online problems. What usually happens is that I can connect, but I cannot do anything. It is like I am not online. I think I found out my problem. It seems that my ISP, in the login process, assigns each user a DNS number. They advise everyone to not use the DNS option in our setup. Can STiK2/Sting do this? Is there some way I can set things up in the CFG file?

It sounds weird that an ISP would assign each user a different DNS number. I work for an ISP and we have 2 sets of DNS numbers that everybody uses (if they want to). I know that an ISP always assigns an IP. I think our Ataris need to have the DNS specified manually. Ask and make sure your ISP has a set of DNS numbers you can use. Have you also checked you MTU value? 1500 is default for most ISPs nowadays but you never know. Try a lower value and see if it makes a difference.

Joshua.

Edward (sorry I couldn't find the other thread)
I wanted to say thanks! It seems that my old Maxtor drive wouldn't
work with the termination switch on my CD on, but the Seagate wouldn't
work properly without it on! It is working great now, and it's nice to have
all the space. I had about given up on it. Thanks so much!

Agreed.

>And "kit cars" cost a ton of money, and hardly ever work right.

This is true only if you are not mechanic enough to assemble it correctly. For example, A hopped up Myers Manx could beat $25,000 or $30,000 Italian sports cars on the race track back in it's day. In 1968 a $30,000 car was _supposed_ to be a lot of car. (But seldom really was.)

And, a kit computer is worthless only if you lack the ability to assemble it.

>You can ride to the Space Station if you have enough millions.

I hope my new program for picking lottery numbers works!

>But can you build an obsolete hackers' computer for only $300?

You can buy an obsolete hacker's computer Goodwill or some other thrift store for a lot less than that.

BTW, I am posting this from a Windows box, but still enjoy just fooling around with an old 8-bit computer almost every day.

Yes, as far as I know.
Bus arbitration is not the same as initiator identification, but bus
arbitration is a feature that requires initiator identification, i. e.
that is not possible without initiator identification. You need bus
arbitration when there are two computers connected to the same SCSI bus.
Without bus arbitration this would not work reliably.

> S/Pdif.

Just a dumb question since you mentioned JamIn. I use JamIn2 and the
JamClock (no S/Pdif). Do you know if there could be a problem in
that combination ? I ask this because although everything seems fine
when I sample music I always have troubles when I want to change it
afterwards, e.g 'normalize' in AudioMaster or when I use 'Denoiser'.
I always get clicks and other noises in, that make the piece sounding
definitely worse than the original and nobody else seems to have
similar problems. Everybody and Mr. Baumgï¿½rtner :) keeps telling me
that AudioMaster and Denoiser are good products and don't cause such
problems.
But I think it can't be SCSI timing because the clock patch has been
applied (and since Rodolphe installed the CT2 I never did notice any
SCSI problems) and I also tried it with the new fast IDE disk and
both times the effects were the same.
So I have no idea what I could do except using all samples as they
are (except cutting) which is not very satisfying.
That's why I rather ask dumb questions then give up all hope.

sorry to bother you
Gerhard

I mean verbatim what I said. Name your specs and I'll find you a PC.
you want QNX? NetBSD, FreeBSD, OpenBSD, NT, Windows (MS), Solaris,
SCO Unix or Unixware?

If the OS is available, it's available on a new PC.

<disclaimer> (and this isn't a cop-out)
This does not include asking for hardware and OS combinations where the
OS doesn't support the hardware you asked for, then claiming I lose
because said hardware won't work, ie: asking for AmigaOS for the Vic-20.
</disclaimer>

<good faith>
I won't just say it's available, I will point you to where you really
can purchase the machine, and actually get a quote for the machine, with
your OS of choice installed, at a very competative price. If you need me
to show you the actual quote to prove it, then so be it.
</good faith>

Not much good at all, I agree.

This is why Microsoft has been so successful, people don't know any better, some people. It has very little to do with availability, or any other notion that "you can't get it" (the competitors product.)

That however, would be ridiculous to try to pin on Microsoft. (although in our courts, anything's possible ;) I can see the headlines now: "Microsoft charged with having customers who don't know any better, Microsoft denies charges, plans to appeal."

The truth is, the customer has choice. If he can't make an informed choice, then maybe we should make more effort to inform people of the choice they do have.

You could get "98lite" which is a piece of software that lets you do a number of things...

1) Install 98 without IE.
2) uninstall IE from a preinstalled 98
3) install 98, and IE, without integrating them.
4) deintegrating IE from a preinstalled 98

You don't need to use this product though, as you can do it yourself if you feel comfortable juggling system files. I might try to dig up the instructions for the DIY method, if I get a chance.

2544. Megafile 30 question

Newsgroup: comp.sys.atari.st
Date: 2001-08-01 10:28:59 UTC
From: mrdelurk@aol.com
Message-ID: <20010801062859.09285.00002172@ng-fa1.aol.com>
Source record: 42911

I have a Megafile 30 that has spent a considerable time in storage. I hooked it up to a Mega 4 ST today, but it won't mount. The fan spins, I can feel the smooth vibration of the rotating HD (when the case is open), and both HD lights (yellow + green) light up and remain lit permanently. I tried to format the drive using Ataris own HD tools but all I got is a "check the cable and try again" error. Same result when using my 1040 STs. When I install a new drive C under TOS, it says there is no drive.

What could be wrong? The cable is rusty but the pins look OK. Also, given the huge size of this Seagate mechanism, what if I installed some Giga capacity drive in this box, instead?

Delurk,

Did you give it a good rap on the side when powering it on (old tv troubleshooting trick)?

Do this in a horizontal direction from the side and not from the top for the best result. Doesn't
have to be hard. Just enough to send a vibration through the drive and hopefully knock the
R/W head loose enough for it to unlock.

If it has a Segate drive inside of it, they were notorious for having a head sticking problem
as they got older. This trick helps to loosen the head lets the drive to start spin up. Problem
lies in a grease they used that gets sticky over time.

Do this at your own risk.

For a "normal" configuration don't edit the DEFAULT.CFG at all! This is
really a bad habit that has its origins from STiK, I believe.

Simply enter your password and username in the STinG Dialer config pages
and off you go. If this does not work its time for manual fiddling with
configuration files.

Another bad habit is to write above the cited text. Thats why this
article looks so messy!

I switched my Milan over to 64K color mode last week.
Most applications work fine, but a couple now display solid black.
One is the MENU_UHR that comes with MagiC, but ran fine with Mint
before in 256-color mode. (FYI, this program puts the date and time
into the menu bar). The other problem application is GEM Ghostscript
(GEMGS13). When the window opened to display a PDF file, the
contents were solid black. Does anyone know the cause, and hopefully
a cure, for this? I'd hate to have to switch back to 256-color mode
every time I need to view a PDF file...

What on earth gave you the idea routing was hard in Linux? IME, it's
a damned sight easier than in anything from MS. It's even easier in
OpenBSD and Solaris.

> wierd protocols like PPPoE)

I see no point in PPPoE. Why would I ever want to use it? I'm not
even sure what uses it other than some broken cable modems used by
inferior providers of no service worthy of my consideration.

So "DEnoiser" actually becomes "NOISER"! ;-)
Definitely not good.

I haven't used Audio Master or Denoiser, but have noticed similar
things in Cubase Audio with normalize. If I need to edit or normalize
or do something else to an audio file, lately I've been porting it
over from the Falcon to my PC (on a SyQuest cartridge), where I use
Cool Edit 2000, then take it back to the Falcon.

> and nobody else seems to have similar problems.

Isn't that always the way it is?

Of course! It makes me a little worried about getting Audio Tracker
now. I didn't have any noise problems with the demo version
(recording on all 8 tracks). Maybe I was just lucky?

And speaking of Audio Tracker (and the JAM 8 Out), All along I've just
been ASSUMING that Audio Tracker does indeed work with the JAM 8 Out,
right? Otherwise there's no point in getting it.

>That's why I rather ask dumb questions then give up all hope.

I know the feeling, but you didn't ask anything that was dumb.

I did a partial translation adapting a former version English resources (1.99 I think). The reason for not to complete it is simple. I don't know German. v1.a .msg file includes Mupfel messages an those are not translated. Anyway, the .rsc is fully translated as well as Desktop messages.
Email me if you are interested.

Regards

But don't most ISPs now assign DNS numbers dynamically, just for
one blink/connection (or am I getting confused with the acronyms)?

But Ed, he says 'Short of buying myself an Atari', so Ghostlink
and/or PARCP won't help him!

On the Atari there is a small program DISKMOD.TOS that will write
an MS-type boot sector from a file BLOCK0.DAT to any floppy disk
without harming the contents. Isn't there something similar on a
PC (probably for DOS)? Mind you, since the data is written from
the 512-byte BLOCK0.DAT file, how does the program know how the
original disk is formatted (number of tracks and sectors,
interleave etc)?

Looking at the BLOCK0.DAT file in a hex editor it seems that it
writes the usual A0 05 for the '# of sectors' (offset $13), which
is the 1440 of a 80 track @ 9 sectors 'standard' disk. That
wouldn't help for a 10-sector 81 track disk or other
'non-standard' formats!

If one has access to a hex editor, one could put the right values
into the file. *BUT* with a hex editor like the one in Harlekin,
which can access any sector, including the boot sector, it would
be easier just to change the first three bytes of the boot sector
to EB 34 90, and the PC would then read it! However, I am not sure
whether this is possible on a PC if it won't recognize the disk. I
guess a good hex editor does not rely on the file structure, but
don't know enough about PC programs. :-(

>>
>>>On the transformer information label it list the output as 5v---1amp??

Actually the label says 5 V, 3.0 A. The 12 V reading could be due
to you measuring it off-load and the problem is quite likely due
to the regulator failing.

>I was told today to look for a matching transformer and if the plug
>does not match, just splice my plug onto the new wire, so I will look
>to see what I can find and post back...

I think you'll find it's more than just a transformer. For a
start, it has auto-switching for 90 to 270 V supply voltages and
it will almost certainly have a regulator (though these circuits
may be combined, I guess) so a plain transformer will not do. You
need proper replacement. Don't know where you'd get that, though -
try a computer repair shop, or find someone whose SyQuest disk
drive has failed but the power unit is OK - I know, easier said
than done!:-) But if space is not a problem, then any regulated 5V
supply would do - from a PC or even a disk drive. Just make sure the
polarity is correct!

Yes, the ISP usually assigns the DNS numbers but it's always the same set of numbers. Everybody (in the same region) gets the same DNS numbers either dynamically or self-assigned.

Joshua.

I guess I'm a total novice about DSL. I have cable, and my Linksys Router/Switch came with directions about setting up PPPoE, but seemed to imply that it's necessary for DSL. I certainly don't need it with cable.

Maybe that sheds some light on this sub-sub-sub-topic?

Vintage Computer Festival 5.0
September 15th and 16th, 2001
Parkside Hall - San Jose Convention Center
San Jose, California
http://www.vintage.org/2001/main/

Mark your calendar! The fifth annual Vintage Computer Festival is scheduled for the weekend of September 15th and 16th at Parkside Hall in San Jose, California.

The Vintage Computer Festival is a celebration of computers and their history. The event features speakers, a vintage computer exhibition, and a vintage computer marketplace. We showcase all different types of computers for all differents kinds of platforms in all different shapes and sizes.

EXHIBIT YOUR VINTAGE COMPUTER

Vintage Computer Collectors: we want you! Exhibit your favorite computer in the Vintage Computer Exhibition. First, Second and Third place prizes will be awarded in 13 categories, including the coveted Best of Show.

For complete details on the VCF 5.0 Exhibition, visit:

http://www.vintage.org/2001/main/exhibit.php

BUY/SELL/TRADE AT THE VINTAGE COMPUTER MARKETPLACE

Do you have some vintage computer items you'd like to sell? Whether you rent a booth or sell on consignment, the Vintage Computer Festival Marketplace is the premier venue for selling old computers and related items. If you would like to rent a booth or inquire about consignment rates, please send e-mail to <vendor@vintage.org> for more information or visit:

http://www.vintage.org/2001/main/vendor.php

TELL A FRIEND! TELL A FRIEND! TELL A FRIEND!

We really hope to see you at the VCF 5.0! And remember, tell your friends!!

A printable flyer in Word format can be downloaded here:

Actually in my area, it's DSL that uses PPPoE...Qwest does it with
some internal DSL modems from Intel so they can turn off the
connection when the person isn't surfing the 'net.

Of course, you can get the DSL without having to use that, but it's
an extra $10 a month plus you have to pay for the modem...they give
you the Intel internal modem for free...

..."are things usually done by someone who should probably spend a
little time learning anyway."

PPPoE is used mostly by DSL providers.

It's a pain in the butt to do in linux, when you have multiple distinct
PPPoE clients that must be routed securely, not just "NATting" them
together behind one PPPoE interface to the DSL.

As far as there being no point in it, if you get stuck having to do it,
you have to do it. (and it sucks)

If nothing else helps I will have to do that too using my spare 2gig
external HD.

> Of course! It makes me a little worried about getting Audio Tracker
> now. I didn't have any noise problems with the demo version
> (recording on all 8 tracks). Maybe I was just lucky?

I don't think you need to worry about that, especially when there
were no problems with the demo version. It seems to be either always
or never. I can use AudioMaster for recording and cutting without
ever having any problem as long as I don't use 'normalize'.

> And speaking of Audio Tracker (and the JAM 8 Out), All along I've just
> been ASSUMING that Audio Tracker does indeed work with the JAM 8 Out,

I had no trouble to use JamIn and JamClock with the Soundpool software
and can't imagine why JamOut should be the negative exception.

I have emailed my ISP for a list of the DNS numbers they use. Hopefully
they will send the list to me so I can insert them into my cfg files. I
will try the MTU thing. It just so strange sometimes. I can be online
and connected and not be able to do anything. Then suddenly I can do
everything and then just as suddenly, can do nothing...

This is not the least bit factual. Intel processors are notoriously ineffecient. all attempts at having them emulate other processors, even older ones, has been a miserable failure.

I have recently aquired an Atari 1040 ST along with a pile of
software.

Unfortunately, the floppy disc drive is broken.

Does anyone know if I can just put a new bog-standard 3.5 inch floppy
drive in it's place, or is it some special type of drive?

Please help.

Replacing the drive in an Atari ST with a standard PC style floppy IS
a commonly done fix.

There are some caveats involved, but it should work well for you.

Is the floppy drive mounted inside the ST case, or is it in an
external case?

You've never played Atari ST games on a PC using an emulator then, I
take it? Or Atari 8-bit computer software on a PC?

Are you absolutely certain the drive IS spinning up?

You should be able to hear it, these old boxes were pretty notorious
for being noisy. (Are you certain the vibration isn't from the fan?)

There should be a definite "spin up" sound when it starts going.

Try using something like a wooden ruler or a pencil, hold it against
your ear and put the other end tightly against the hard drive
mechanism case, then power it up. The sound should be transmitted to
your ear so you can hear it a lot better. You should hear the drive
start up like Airwolf flying out of a canyon, and there should be some
definite clicking and honking noises as the heads seek during the
spinup process.

The reason for doing all this is that some of the old Seagate drive
mechanisms used in these boxes had a problem called "stiction" where
the drive heads would actually stick to the platters when the drive
was spun down. Then when you turned the drive on again, the motor
didn't have enough power to spin the platters against the force of the
adhesion.

I had a drive that I had to leave running because if I ever turned it
off, it was a real song and dance to get it spinning again (and God
help me if there was a power failure).

If you're planning on formatting the drive anyway, you CAN pretty
easily replace the mechanism with a larger SCSI drive. There are some
limitations on size due to the various Hard Drive Drivers, so don't go
too wild with Multi-Mega-Gigabytes.

Hopefully someone else here can give you more current recommendations
on what driver to use and what sizes are practical.

(and remember- you could probably put every Atari ST program ever created on a 1 GB drive)

>and can't imagine why JamOut should be the negative exception.

Well, I asked SoundPool about using the JAM 8 Out with Audio Tracker.
Here's what I was told today in e-mail:

"The AudioTracker does NOT work properly with JAM 8 series."
"We have had several problem with customers who have JAM 8."

T.Baumg&#65533;rtner

I've more or less lined up a good deal on the used JAM 8 Out (hello
Ken, I'm sure you're reading this!). Now I'm not sure what to do. Is
this just SoundPool propaganda? (ie. "only OUR hardware is worth
anything, all else is CRAP"!). Or is this something I should be
concerned with? I haven't ordered the Audio Tracker software yet, and
I'm not sure I should.

Has anyone here EVER used these two products together successfully?
(JAM 8 OUT wih Audio Tracker)

The 12 v reading on pin-3 was my error, I was reading it as a AC
transformer. Once I set my voltage tester for DC voltage the pin-3
reading was 5.5 volts. So I think I will move the black wire from
pin-2 0 reading to pin-3 5.5 reading......

Hey Dunny

Don't waste our time. You have not proof. I've been programming and working in electronics for years not only as a hobby but also in my career. I am quite familiar with the intel, 6502 and other processors. You simply cannot effieciently emulate one cisc process on another. Its physically impossible.

Bob,

I've made the rounds of nearly all the emulators. No fallacious arguments to say software emulation is easy or stable can hold up to scrutiny. take a close look at what you need to emulate a stock 8mhz ST on any PC, it isnt the least bit realistic on anything less than a Pemtium2-200 and certainly isn't stable. Risc processors have a better time with emulation but don't even try to waste more of my time saying any intel processor can do a good job of it. It simply isn't bact up by any fact, and likely never will be.

Utter nonsense.

The architecture of the Z80 (used in the Spectrum Dunny referred to) and
x86 have a common ancestor (the 8080) which means you can produce some
very effecient emulation because many things, like flags etc, are very
similar.

So how is it that by sitting in front of a pentium 150 I can run JPP or Realspec (slowly) and play a nice game of cybernoid? Hmm? You sir, are talking out of your bottom.

For more proof, visit www.worldofspectrum.org and see what a KNOW LIAR you are.

James,

Usually when emulation other architectures the biggest problem is not the
CPU emulation, but the rest of the hardware. Emulating a 68000 on a PC is
not a problem, but emulating all strange programming hacks on the hardware
is, regardless if the emulating is done on a x86, PPC, or whatever.
Tosbox does not emulate every aspect of the hardware, and emulate an ST at
full speed on my old P120 laptop. When I want to play games, I use my AMD
K6-3 450, and Steem. It is very hard to emulate the x86 or Z80 on the 68000,
as there are big differences between these cpu families.
To emulate a Spectrum (z80) at full speed on a PC, you need no more than a
386sx, as the Z80 and x86 is pretty similar.
PC processors are very cheap, you can get an AMD K6-2 450 for like 50€ here
in Sweden, and complete second hand intel P2-200 system (like you mentioned)
cost like 100€ without monitor. Speed is not really a problem here, James.
I am a bit anti-intel too, I think it is a terrible architecture, but it is
cheaper than everything else, and it is fast.

Regards

/Peter Persson, Tech Writer, HMS Industrial Networks AB

Has anyone had any experience of using
DataRescue's IDA Pro (or the freeware version)
to examine Atari executables? If so, can you
give me a brief guide to how to approach the
following:

1) Getting the image ready for reading into IDA.
(E.g. exe from disk, or saving a memory area
from within an emulator's debugger)

2) Reading into IDA. Will it auto-analyze or do
you need to hunt for a start point? Is there
a .idc file available for trap or commonly
used address names?

Many thanks,

Mark

Hi,
I never used AudioTracker myself, but I used the JAM-8 with Cubase Audio
with great success. I have heard of some interfaces having problems where
the outputs would shift occationally. A little annoying, but Line Audio
Design made a simple hardware fix (I believe there are only a few resistors
to add in the JAM) to get rid of the problem - at least if CAF. Maybe that's
what SoundPool have heard about?

Best regards,
Claes

Sorry- After I'd hit Return on that reply I looked back and saw that you;d said it was a 1040ST. All the 1040s had internal floppy disk drives. Oops.

Anyway, you can replace the internal floppy drive with a current PC style floppy drive, with a few things to watch out for-

First of all, the 1040 cannot use High Density (1.44Meg) floppy disks unless it's modified beyond a simple drive replacement. That's OK, because all PC floppy drives will also work in Double Density (720K) mode. You should be able to format DSDD (Double Sided, Double Density) floppy disks for use with the ST with no problems at all.

Secondly, you can use ALMOST any normal PC floppy disk. The most important thing to note is that the Atari ST requires the floppy disk drive to be set as "Drive 0". Most all PC drives come set to be "Drive 1". That's OK, as long as there is a jumper on the drive allowing the setting to be changed to Drive 0. Unfortunately recent PC floppy drives have been turning up which do NOT have a jumper to change this setting since no one ever needs to do it normally.

You MUST insure that the floppy drive you plan to use has a jumper allowing it to be set as Drive 0. For this reason, it's probably best to buy it from a local dealer who has a competent service

department who will be able to tell if their drives meet this requirement. CompUSA and Best Buy will undoubtedly NOT be able to tell you if their drives do. Likewise, buying over the internet would probably be risky unless you're absolutely sure you can get a straight answer from the dealer before you buy the drive.

Next thing- the cable that plugs into the drive in the ST now, the original drive, is most probably going to need to be turned "upside down" to plug into the new drive properly. Most of the floppy drive mechanisms Atari used had the connector backwards from what has become the "standard" today. This usually isn't a problem, but on some models the cable may be pretty short, and turning it over can be difficult. The power connector from the old drive will fit the new drive.

Then, the new drive is not going to fit into the same space the Atari drive currently occupies, very well. The new drive will be thinner, meaning you may have to work out some way to mount it, AND the "faceplate" of the drive will not fit the same cutout opening in the side of the ST. In most cases you can use an X-Acto knife and Razor Saw to cut the case to fit.

Lastly, (and possibly the most troublesome part of all this), the way Atari implemented the "Media Change Line" is different from the way modern floppy drives work.

That is, when you pop out a disk and put a new one in the drive, there is a signal generated which informs the computer of the change, and alerts it that there is a new, different disk in the drive now.

Because the new PC floppy does this differently, the ST is not going to have a reliable way to tell that there is a new disk when you change them.

The ramification of this is that if you open a disk, to get the directory, then pop it out and put in a new disk, then write a file out to the new disk, the Atari won't know the disk has changed, and will use the directory of the old disk to save the file on the new disk. This will trash the new disk.

You can avoid this potentially disastrous situation by closing the directory window and reopening it when the new disk is in the drive. This should read the new directory in from the new disk.

You can also press the ESC key when a directory window is open, which will force a re-read of the directory.

There is also a way to modify the new PC floppy drive to emulate the Atari Media Change Line signal, but unfortunately I haven't been able to locate the text files that tell how to do this.

You COULD just try to find another Atari floppy drive to replace the one in the 1040ST. In that case replacing the drive is a very simple

matter of swapping the mechanism.

However, there are no new units available, so you have to find a used one. If you look on eBay, in the "Classic Computers" category (I think that's what they call it), you can occasionally find people selling external disk drives. These were used as the main disk drive for the old, original 520ST, and as the "B" drive for units like your 1040ST. These often sell for next to nothing, and you could easily take the case apart and use the floppy disk mechanism to replace the one in your 1040. If you decide to do this, be sure to look for model SF314, which was the Double Sided model.

The drawback to doing this is that any floppy drive you get would be easily as old as the one you're replacing.

The advantage of course is you could avoid all the "gotchas" of using a PC drive.

Good luck!

BobR

hEI All.
With the prices of Graphics cards lowering, Is there any development to adapt or port them to the Atari TT030 scene. i noticed from ebay only one at the time, but by the time I tried to
register, the little bugger had gone. I must admit even when i look for Apple mac Laptop they
were like looking for needle in a haystack. So how about it sit down and take out your pipe and discuss.

regards.

**** ANNOUNCEMENT: NEW URL ****

The UNI_MANiacs support page has moved !!!

Old address: http://www.telebyte.nl/~mt/uni_man.htm

NEW ADDRESS: http://uniman.atari.org

(this will redirect you to http://www.home.zonnet.nl/m.tarenskeen/uni_man.htm
My internet account on telebyte.nl will soon end, and the old URL with it)
So if you use Zadok's UNI_MAN - the universal MIDI SysEx toolkit for
Atari computers - you can now find the support and device adaptors you need here:

http://uniman.atari.org

This URL will stay even if I would choose another provider somewhere in the future.

**** END OF ANNOUNCEMENT ****

Harry is busy running a house of ill repute for circus dwarfs, he did
announce some while ago that he was giving up this list and offered it up
for interested parties to take on board, he's probably watching right now
and will fil us in, just after he's greased up that chicken in the box.

2621. ESNA: CD Writer Suite 3.2

Newsgroup: comp.sys.atari.st
Date: 2001-08-05 02:18:56 UTC
From: Bengy <bengy@mac.com>
Message-ID: <B792092F.22AA%bengy@mac.com>
Source record: 42889

CD Writer Suite is now at version 3.2, and available immediately from ESNA.
CD Writer Suite v3.2 offers:

*a modern interface
*recording at 4x on 68030 and faster systems
*recording at 2x even on 68000 systems
*reliable writes, time after time
*easy installation: no dongle required!
*simulate-before-writing feature
*support for HP, Philips, TEAC, Plextor, Yamaha, and many
SCSI3/MMC-compliant CD recorder

Although the version number has increased, the price has stayed the same. CD
Writer Suite 3.2 is available for $89.95US or $109.95CND.

If it has a double sided drive then you should be able to format a
double density disk (720k) from windows.

If it's single sided, you will have to use the DOS command from MS-DOS:
format a: f:360 or something like that

>side of the ST. In most cases you can use an X-Acto knife and Razor
>Saw to cut the case to fit.

hmmm.. all the drives i have for pc's are all the same size!!!! maybe
this is something to do with cases and their 3.5" bays!!!!!!

Only the old single sided drives are larger in the ST, the other are the
same size as the high density drive pc's use.

>
>Lastly, (and possibly the most troublesome part of all this), the way

iirc the atari monitors the read/write protect line to detect a disk
change.

>

>will force a re-read of the directory.

not always:(((pressing the ESC key is a way of finding out if the
machine has detected a change of media and WILL updated it if it has
noticed it.

BUT it may not work all the time.

I use the ESC key test for incompatible 3.5" floppy drives, if you
change a disk and press ESC it SHOULD updated the buffers/cache and
display the new directory!!

If it doesn't then the drive isn't detecting the change of media etc.

There are programs around this to allow a force media change.

My advice anyway, even on a atari with original drive, is to check that
the directory window has been updated AFTER every disk change.

This incidentally isn't just a problem for high density drives but also
double density drives as well.

>model SF314, which was the Double Sided model.

You can also use external drive mechanisms for the amiga as companies
like zydec use the same type of mechanism just different cable:))

The Amiga A1200 uses a standard double density floppy with the standard
shurgart interface. Not sure whether other models do though!

I know many people that have used external drive mechanisms to replace
the internal one.

The only problem being some case cutting is usually needed. Even with
drives from the original Atari external drives, as not all ST's comform
to the same eject button.

>
>The drawback to doing this is that any floppy drive you get would be

2629. MiNT + SCC.XDD + STiK

Newsgroup: comp.sys.atari.st
Date: 2001-08-05 10:07:28 UTC
From: m.tarenskeen@zonnet.nl
Message-ID: <AV8b7.24075$Vs4.224295@zonnet-reader-1>
Source record: 42798

I have a Falcon030 running MiNT+XaAES+Thing+STiK2+Qdialer+HSMODEM.
All in their latest versions. (NOTE: MiNT newest version 1.15.12 just
released. Check it out at www.freemint.de !)

I don't have all that unixlike stuff, no extented filesystems on my HD
partitions, and no Mintnet installed. I'm quite happy with it for the
moment.

Now I have tried to install SCC.XDD as a replacement of HSMODEM.
(de-installing DRVIN.PRG+SCC.PRG from my autofolder)
But it doesn't work. When I try to connect using Qdialer, the dialer hangs
up somewhere during the connection process. With HSMODEM instead,
everything works fine again. Should I consider installing MiNTnet, or
can I avoid going into that scary looking installationprocess and just
keep using STiK or STiNG, and still be able to replace HSMODEM? I do
find it attractive to have less programs in my autofolder.

Can anyone help?

Martin Tarenskeen
creator of YSEDITOR PLUS
http://yseditor.atari.org

(P.S. Someone should make a really userfriendly MiNT/MiNTnet installation
package with the non-technical user in mind. Could be a real hit, and
finally make MiNT available as an alternative for MagiC to more
Atarians. May cost something, just like there are commercial distributions
of the "free" Linux for the PC)

Recent kernels can be compiled with their version of GCC. When RedHat 7.0 came out this problem did exist indeed, but it has been resolved by now.

Gcc 2.9.6 was the most stupid thing they have done in years anyway. But apart from that I find RedHat quite usable, although not perfect. But who is?

Indeed, these special drivers seems not to work with STik/Sting. the
ppp-negotiations fails.

I should say go for MiNT-net. It isn't that scary at all. It needs only
lots of reading.

You should try once the MiNT-net installation for dummies:
http://www.ndh.net/home/kehr/atari/Atari.htm
Not an easy-to-install package in the reals sence of the word but it
contains everything one need to know/have to get online.

Did u coment out all HSMODEM stuff in MiNT cnf? U can try and comment
out all HSMODEM lines, maybe even all serial lines.. (commenting out means
u pur "#" on beggining of line) You did put XDD in mint folder? ;))

> (P.S. Someone should make a really userfriendly MiNT/MiNTnet installation
> package with the non-technical user in mind. Could be a real hit, and
> finally make MiNT available as an alternative for MagiC to more
> Atarians. May cost something, just like there are commercial distributions
> of the "free" Linux for the PC)

Basic KGMD installation (without fixing, since its now a tad obsolete)
requires dowloading lotsa files, copying all of them in same directory,
downloading and unpacking instflpy.zoo in same dir and running installer..
Then u are asked few question like what partiton will be mint
partition, what FS will u use, where is KGMD package and your username and
user and root passwords.. Then u may sit and watch TV for some 30 mins and
MiNT is installed.. (there may be some machine dependand probs) Thats all.

We did also a package which did replace and add new features on MiNT
setup especialy for begginers.. It requires copying package to HOME
directory, runing tar depacker and starting install script... Of course
its super wise to read DOCs before, also there are nice HYP's on net, even
Papyrus document.. my experiences says noone actuay do that :))

Fixing, adding stuff, modifying FS structure aint as easy as install,
but if u wana use UNIX and not used to it, thats nice school and warmup
period for later usage.. Im still covinces few hardnuts and probs learns u
more as book only.. no mater how thick is..

Linux instalation is used for example.. Its a bit of a double sword
imho. U put CD in, start install and that is.. Still does user now may
go and use Linux, esp CLI etc if he had no knowledge?

2637. Misc ST Items and More FS (USA)

Newsgroup: comp.sys.atari.st
Date: 2001-08-05 16:00:56 UTC
From: fmhcom@operamail.com
Message-ID: <Y4eb7.116$Yd1.141320@newsfeed.slurp.net>
Source record: 42806

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured
word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

The Complete Atari MINT CD by Whiteline. Everything you could ever
want/need with MINT for your Atari computer. X11, PERL, HUGE, TCL,
GNU C++, MINTos, MINTnet, FTP, Telnet, and all the MINT Distribution
kits. Over 330 Meg of data. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

considering selling, I have two one with Nemisis and one with Powerup and
all they do these days is Invoices

2639. FS: Atari 1040 STe system Toronto, Canada

Newsgroup: comp.sys.atari.st
Date: 2001-08-05 18:04:52 UTC
From: David Goulden <forsale@zanid.com>
Message-ID: <RPfb7.438$5c.50725@news20.bellglobal.com>
Source record: 42808

Hello,

I have the following for sale:

Atari 1040 STe computer, 4MB RAM, no HD, midi in/out, SM125 B/W monitor,
SC1224 Colour monitor, 9 issues of ST Format magazine with disks, Notator
MIDI sequencing software, various other shareware/freeware/demo software.

I live in Toronto, Canada and would REALLY rather not deal with the hassle
of finding boxes and padding for the monitors, but I'd consider shipping the
other items. Although I'm asking CDN $100, make me an offer. I'm less
concerned about money than I am about giving the system to someone who will
appreciate it.

Visit http://www.zanid.com/forsale for a picture and details.

Thanks,

David

2640. Milan for sale??

Newsgroup: comp.sys.atari.st
Date: 2001-08-05 19:06:08 UTC
From: rking@zetnet.co.uk
Message-ID: <3b6d9920$0$18559@news.zetnet.co.uk>
Source record: 42810

Hi all,

I'm getting a Blue and White G3 Mac and will probably be selling my Milan and Multisync Taxan monitor and colour printer. Just to warn any one thinking of making a killing, I will be asking a realistic price for the package, as it's got SCSI card and two CDs one of which is CDW . As a graphics M/C. its all you could ask, but there is NO DTP software available (including Calamus) thats up to the grade, and that's what I'm into. I will be keeping my Falcons, standard and C-Lab MkX, as they are an engineering marvel and a rock steady Midi platform.
I'll let you know of my price, when I've worked it out (providing the G3 is OK).

Bob King.

The magnetic coating on an HD disk is different to that on a DD disk. It
needs a much stronger
magnetic field to make sure it is permanently magnetised. So I would not
recommend using an HD disk for long
term data storage. However in an emergancy you can cover up the media sense
hole, and the disk will usually format
and work. But its likley to "forget" what you have stored on it. I think
last time I tried this they died after a coupld of months..

> information?

Ok. look in your crystal ball... how many people will get a linux PC when they
walk in Fred Meyer over a Windows PC?
They get the PC, then ask to look at the software section, or maybe ask if
they can run the same software they saw at their friend house.

I'm sure it better today and you dont have to spend a week getting a dev environment
to get basic tool to work. But its still a far cry from the software you get under windows.

Like you hint, the guy probably dont know linux.... can you imagine the guy walking back
asking for basic question as to why his new directx game wont install, or how does he
setup the new usb scanner he just got... or import his digital camera images, etc.. etc..
etc..

We are talking about 0.000001% . Thats why Dell droped the ball on linux. They dont offer
this as an option anymore. They realized that linux market is super specialized server and
hacker.
And hackers build their own PC's :)

BTW, I beleive its possible to have API like directx working on linux... So 'pure' directx
dev
could be ported in a snap to linux, but who we spend that level or R&D for those linux
user?

Stephan

I think they took it like "Remove your network stack, bad bad boy! you are a monopoly
you can integrate a network stack!" and from a totaly stupid request they just said "no
cant do"
because giving a valid answer wouldn't have made a diference.
In my view MS is really down at many people like they are technologie moron.

Anyway, lets look in 5 year as to what OS WONT have an integrated HTML 'parser' in the OS
as a base API service.
Should the US gov (and tax payer) bring to court QNX, Beos, etc.. ?

BTW, what happen when you type a ftp or http address in an explorer windows?
If you install Netscape can you 'fix' the now broken desktop and allow for those space to
be browsed again?
Who make 'namespace' http support for windows?

Anyway... time will again prove MS right and linux will follow.

Stephan

2648. RF adapter for 520STfm?

Newsgroup: comp.sys.atari.st
Date: 2001-08-06 01:43:29 UTC
From: Rodney Hester <rod3@mindspring.com>
Message-ID: <9kksoa$821$1@slb7.atl.mindspring.net>
Source record: 42819

What kind of TV adapter is needed? I have an old 2600 adapter which doesn't seem to work, nor will it provide a signal on a composite monitor...is a "special" adapter required?

Rodney

Atari never manufactured monitors for their Home Computer line.

Would have been a nice addition to their catalog to have a
color-matched video monitor, but those things were probably too
expensive in those days to sell to Atari's intended audience.

I was at the Chicago "Consumer Electronics Show" when Atari introduced
the 130XE model, but I can't remember what kind of monitors they were
using in the displays. (That was the era they would have brought out
a monitor for the 8-bit if they were ever going to do it, but nothing
ever showed up in their product line.)

Atari was too busy introducing the 260ST and 520ST at that show to
spend much time on the 8-bit computers. People would walk up to the
130XE, look at it for a second, realize it wasn't the ST, and turn
right around, heading for the other side of the room,

I wonder if any "prototype" monitors might exist somewhere though...

I have seen shots of what appears to be an SC1224, but with the red atari logo. They were shown in Explorer in the mid eighties, during the 130XE release. As far as I know they were never put into production.

The STFM has one built in.Are you trying to replace the internal unit? RF and composite are verrrryyyy different. One is modulated and carries all the signals (RF), and the other is a video signal only. If you need composite it is derived from the 13 pin monitor socket.

First of all, the 520STfm video output CAN NOT be used with a
composite monitor. It HAS to be connected to the ANTENNA on your TV
set.

The STfm (floppy drive, RF modulator) doesn't need anything special,
as the RF modulator is already built into the system.

The 2600 switchbox you have should work fine.

You need a cable with RCA plugs on both ends, one end goes to the 2600
switchbox, the other end plugs into the back of the ST. It's pretty
obvious, there's only one place it can plug in.

Then the 2600 switchbox has to connect to the TV set's ANTENNA
input. .

Tune the TV set to either Channel 3 or Channel 4 (there is a tiny
slide switch next to the RCA jack on the back of the ST to set the
channel. Choose whichever channel is not in use in your area), and
you should be able to see the ST screen.

If you DO want to connect the ST to a composite monitor, you may be in
luck. The models with built in RF modulators usually have the
composite video signal brought out on one of the pins in the normal ST
monitor socket.

You would have to get a plug which will fit the socket and wire it up
to the monitor. There are text files floating around on the web which
go into detail about how to do this.

>term data storage.

The magnetic field used in double density drives is much stronger than
those used in modern high density drives. So much so that data around
the sector being written, and on the other side of the disk get
corrupted:(

I have only 1 double density disk drive that will read high density
disks formatted as a dd.

It's a common mistake, all disks are not the same:(

> However in an emergancy you can cover up the media sense
>hole, and the disk will usually format
>and work. But its likley to "forget" what you have stored on it. I think

Yep, all it takes is one bit of data in the data stream to be wrong and
that's it the program or whatever has had it!!

Cheap mouse... I do have some rodents around, I'm in the UK though. I,
as far as i know, can still get hold of new rodents for amiga/atari!!

> Why should they have to though? What extra power would my parents get (word
> processing, internet, dtp, spreadsheet) by using Linux over Windows or her
> Mac (actually my old Mac)?

None if they can use Office/Works already. I would give the Unix
Office applications a year to become functionally more useful than the
MSOffice equivalents. By more useful I don't mean that they will do
everything that the equivalent MS program would do, but it would do it
correctly. Office has so many bugs it is unbelievable. Still, large
software programs have bugs, so the Unix Office apps will get them as
well. I just hope that the emphasis for the Unix Office apps is going
to be stability and bug fixing over feature bloat.

The Windows interface is just as confusing to newbies as the Linux one
(say, KDE). Except that KDE comes with a whole pile of apps
preinstalled for free, KOffice, Konqueror, silly games, etc. Linux is
just a mess under the surface though, and the surface is dodgy. For a
home user desktop, it needs a single, consistent interface, easy to
configure printers, hardware, etc. MS is way ahead in these areas. QNX
is the best alternative desktop OS I have seen to date.

> What advantages would I have in using Linux over
> Windows as an application programmer using VB, C++ Builder, VC++, Jbuilder,

VB - MS Technology
C++ Builder - Borland
VC++ - MS
JBuilder - Borland
SQLServer - MS

You would get none, of course. What advantages would I have in Windows
over Linux as a server programmer using Perl, PHP, Python,
PostgresQL/Oracle/MySQL?

Hence you should use the more secure alternatives with length
parameters to prevent buffer overflows, such as strncpy.

Source record: 42831

This little patch fixes two problems in the Falcon BIOS (TOS 4.00-4.04)

(1) Sound is not initialized properly.
(2) Bconmap() doesn't work.

To use it, copy FPATCH2.PRG to your AUTO folder.

This patch supersedes FPATCH1.PRG. The former worked by hooking into
the BIOS trap and intercepting Bconxxx calls. This patch fixes the
Bconmap problem directly (by setting the Bconmap table size to its
correct value) and hence requires no resident code. It also has
the benefit of allowing the Falcon LAN port to be accessed via
the BIOS.

And in particular, scanf(), gets(), sprintf(), strcpy() are not OS
functions but C runtime library functions, and the security holes
within these functions are present in *all* C runtime libraries,
including those running under MS-Windoze....

scanf() in particular is useless for anything but quick'n'dirty
throw-away test programs, and should never be used in a real
application.

>what SoundPool have heard about?

That's interesting. At first I was thinking that they meant the
device simply would not work at all with their software (as if the
hardware was incompatible in some way). But if it works with CAF, I
assume, hardware-wise, it's basically the same as the Analog 8 Out,
since CAF was not specifically designed to use LINE AUDIO devices.

And since Audio Tracker works with the Analog 8 Out, one would think
the JAM 8 Out should also work. Re-reading what SoundPool wrote, they
did say:

"The AudioTracker does NOT work __properly__ with JAM 8 series".
[I added the emphasis on "properly"]
"We have had several problem with customers who have JAM 8."

So they could very well simply be refering to the problem you
mentioned above. The person selling the JAM 8 Out tells me he has not
had any noise problems when he used it with CAF. I guess the only way
to know for sure is to test it myself.

Thanks Claes.

Serial connection is limited to only a couple of meters I thought (max 18) -
can someone confirm this?

> How do I setup STiNG on the Falcon end?

Take a look at :
http://gallery.uunet.be/saka/atari/lan/ser_atari-pc.htm

> How do I setup Wingate?

don't know... there is maybe a FAQ at the WinGate site...

2666. SH204 Problems.

Newsgroup: comp.sys.atari.st
Date: 2001-08-06 18:42:49 UTC
From: Erik Closson <sqwirl@atarist.com>
Message-ID: <JyBb7.1458$PP1.16113468@news2.news.adelphia.net>
Source record: 42838

Well I got a SH204 HDD in the mail the other day and hooked it up. Booted perfectly right away from the last persons files. Then I accidently overwrote the desktop.inf and in trying to get the drive letters back I somehow made the drive not bootable. AHDI detects it and when I try to make it bootable it says please partition. I then try to partition and it tells me to format first. I try to format and it completes the format and exits hdx. I restart the computer and try to run partition and it tells me that this computer has been formatted with an different version of ahdi and says format again. Anyone know of a different HDD driver I could use or what is wrong with this. Or possibly the version of AHDI that came with the SH204.
Thanks
Erik Closson

2667. [SEARCH] Deuteros and help

Newsgroup: comp.sys.atari.st
Date: 2001-08-06 20:12:44 UTC
From: Olivier VANONI <ovanoni@icor.fr>
Message-ID: <WS3.3aba9f1e.832c1ac2.ovanoni@icor.fr>

Hello.

I'm looking for the game Deuteros (the next Millenium), an original one
of course with if possible the box and handbook.
Also, can one of you give me any information about the way to go, without
of course giving me the solution.

Please answer me by mail.

Thanks.

just what is a "Bconmap" ?

and was it the STe compatibility sound that wasn't initialised
correctly, or..?

Just curious :-)

It depends on speed. In theory at 64k maximum distance is I think around
15ft. At 9600 I have used lengths of 200 meters or so. If you use good
quality, low capacitance cable, I would expect up to 100 feet, but it
depends on many other things.

An "FM" should not need an adaptor. It should have RF out on the back. If it
is just an "F" it won't have RF out, nor will it have
composite, as this is generated in the on-board modulator. So you need
either a Monitor that understands RGB or a modulator
that accepts RGB.

> had any noise problems when he used it with CAF. I guess the only way
> to know for sure is to test it myself.

Hi,
I used a FA-8 before I got my JAM-8 and there was no difference in functionality - except that the JAM has balanced outputs (someone claimed that the JAM had better converters and a better sound quality thanks to this, but I never had the possibility to make an A/B-test myself...).
Maybe you should also ask Roger, who runs Line Audio Design and who designed the JAM and FAD units. Then you could maybe get the schematics for the modifications you _might_ need. The website is at www.lineaudio.se .
The cases I've heard of when it comes to problems with JAM+CAF have been rare, so it's probably most likely that it works without any problems...

Bob,

Therre is absolutely NO WAY to put a scsi drive in a megafile 30. The megafile 30 and 60 models were RLL only. Only an RLL drive will work. You cant just stuff a 50 pin scsi connector on the RLL's 2 cables which are 20pins and 34 pins

> Erik Closson
>

Hi Erik,
This is what I would do, but please get another opinion as there
are more experienced users than myself.

Your SH204 should have come with a Boot Disk.
It is important to keep all these files together.
Don't mixmatch versions.

AUTO - Contains AHDI.PRG
HDX.PRG
HDX.RSC
SHIP.PRG
WINCAP

Warm boot your system - Press CNTRL ALT DELETE simultaneously,
then hold down CNTRL for a few seconds after the Atari Logo
appears on the screen.
You should see icons A B and C.
A and B are Floppy, C is for hard disk.
Double click on the C icon.
Look for a file called AHDI.PRG - It should reside in a folder called
AUTO
Delete it.
Turn off computer, hard disk and monitor. In that order.

Well, not knowing what kind of computer you are using,
I assume it is a 1040stf.
Put the boot disk in the floppy drive. This is of course
assuming that you have AHDI.PRG in the AUTO folder of the boot disk.
Turn on the hard drive, let it initialize, then the computer.
(So your booting from the floppy and accessing the hard drive via

AHDI.PRG in the AUTO folder)

Hopefully you can backup all your data on your hard drive.
Do this first.

Now run HDX.PRG from the floppy
(Formatting will erase everything on your hard drive!)

Select physical unit
UNIT O (assuming that the SH204 is all you have connected)

Pick disk type
SH204

Select Yes to format

After formatting is completed, Partition your drive.

Select physical unit
UNIT O

Edit partition parameters or Pick a partition scheme:

Select Yes to Partition

In order to access the partitions, (other than the first, or C)
you must install the drives from the GEM Desktop.
Select the Drive C icon, them move up to the Options Menu on the GEM
Desktop and select install Disk Drive.
When the Install Disk Drive Box appears, change the Drive Identifier to D.
Click on the Install Box to install the logical drive.
The Drive D icon should appear on the desktop.

Repeat the installing procedure for each partition, identifying the
logical drives in alphabetical order.

After installing all partitions, save the desktop.
Select Save Desktop from the Options Menu.
The Desktop will be saved to Drive C.
This will be your new Desktop.inf

Now if you want your system to boot from the Hard Drive and not
the Floppy.
Make a folder on your C partition called AUTO.
Copy AHDI.PRG from floppy A to the AUTO folder on C
(After this I usually keep a blank formatted disk in the floppy drive -
don't forget to take out your SH204 boot disk)

That should do it!

Hope this helps, but again, please get another opinion.

ken

Atari used standard SCSI drive mechanisms in SOME of their hard drives. If yours is one of those, you can pretty easily simply unplug the old drive and plug in a new, bigger drive.

There are some restrictions on the size of the new drive, depending on which harddrive driver you're using. Some of the more recent versions of the drivers address this limitation and let you go bigger with fewer restrictions.

I haven't kept up with the developments in harddrive drivers, but I'm sure someone here can recommend the best one to use for larger SCSI drives.

However- SOME of the Atari hard drives used MFM style hard drive mechanisms. If yours is this style, you probably won't be able to find new drives for it. MFM drives haven't been manufactured in a long, long time.

You can check to see what kind your drive is by opening the case and looking at the hard drive mechanism.

A SCSI drive has ONE data ribbon cable plugged into the back (not counting the black, yellow and red power cable), about 2 1/2 inches wide.

An MFM drive has TWO data cables plugged in, one about 1 inch wide, and the other about 2 inches wide.

(You might even be able to tell the type of drive from the bootup messages on your screen, but I haven't seen my hard drive boot since the "stiction" effect caused the platter to rip the heads off one time

the power failed and the drive stopped. That was quite a while ago, and I still haven;t gotten around to adding the DEC SCSI drives I got for free from the place I worked. I was at the right place at the right time and they were throwing these in the trash because they were too "small". I think they're 80 Mb each, which makes them each 4x bigger than the drive I had. I figure 160 Mb will hold just about all the Atari programs I've ever seen.)

Thinking about it, I think I remember that the MFM drives actually used a SCSI host adapter to convert the ASCI from the computer to SCSI, then there was a second board inside the case that converted the SCSI into MFM. (This is all pretty hazy.) If that's the case in your drive, (assuming it's MFM in the first place), you might actually be able to remove the MFM drive and converter board and add a standard SCSI drive to the host adapter. I have vague recollections of someone doing this a long, long time ago.

Maybe you'll get lucky and have a SCSI system and not have to worry about any of this..!

WE NEED MORE GRAPHISTS 4 OUR STRATEGY MEDIEVAL FANTASY GAME 4 FALCON AND MORE

This is a call to all the graphists who love ATARI and who would really like to take part in the realisation of a stategy medieval fantasy game (a bit like Conquest Of Elysium 2, a bit like Age of Wonder (PC), a bit like Heroes of the might and magic 2/3 (PC)).

Well many things have been etablished.
We need at leats 8 graphists and we are only 3 for the moment.
We have enough coders and musicians.
We could need some good ideas if someone is really experienced in the creation of such games.
This game would run on Falcon and more (Milan, Had&#65533;s, TT, Medusa...) in 640*4(8/0)0*8 reso.

It's really urgent !!

Let's subscribe 2 the group which is etablished at http://groups.yahoo.com/group/atarihfstratgame to contact the group and get more info if U're really interested !!

We need YOU !!

4 ATARI and 4 the CREATION 4 FUN !
Let's join us !!

And always remember ATARI rules 4 EVER !!!!

>

I wasn't sure at what point Atari started putting SCSI drives in their
hard drive cases. Guess that leaves the Megafile out of the "easy
upgrade" arena.

Do you recall how the interface boards were set up in those older
drives?

I have a hazy recollection that they used an ASCI-SCSI host adapter,
then a second adapter board to convert the SCSI to the Shugart
(MFM/RLL) interface format.

I think someone in our local club was looking into removing the
SCSI-Shugart board and going directly to a SCSI drive from the
ASCI-SCSI host adapter, but I never heard how it turned out.

The only external SCSI drive manufactured by Atari was the SyQuest 44 MB
drive.

Hi,

Someone gave me the wonderful Falcon... Great ! But as I'm a newbie with this bird, I need some advices :

The falcon doesn't have any HD, so

1. I've got a Quantum Fireball 1050S 1,05 Gb (no PO control) which does not run on my MegaSTE, can I use it on my Falcon ? And how can I connect it ? (what kind of SCSI adapter ? How can I plug the power supply ?...)

2. If I want to connect an internal IDE drive, do I need special adapter ?

3. Can the falcon maange big partitions ?

Thanks

The problem with most of the Fireball drives is that they required the
computer to have a SCSI ID of its own (initiator identification). The
Falcon and the TT cannot boot from such a drive. You need CBHD or
HDDRIVER as a hard disk driver with these drives. No special SCSI
adapter is requird for the Falcon. Just connect it to the Falcon's SCSI
port with standard equipment.
BTW; you can also use this drive with the MegaSTE, provided that you
have a LINK96 or LINK97 host adapter.

> 3. Can the falcon maange big partitions ?

The Falcon TOS supports TOS-compatible partitions up to 1 GB.

Source record: 42765

1. You need an external SCSI enclosure to use your SCSI drive. The enclosure will have a built-in power supply for the HD. You need to purchase a SCSI cable to connect the Falcon the the external device. The Falcon end has to a 50-pin half-pitch connector and the other end whatever the case has.

2. If you connect an internal 2.5" IDE drive, you don't need an adapter. Just the ribbon cable. If you want to use a 3.5" drive, you need an adapter. You can also make one yourself from cable if you're handy with that stuff. 2.5" and 3.5" IDE are pin-to-pin compatible except that the 2.5" drive has 4 extra pins for power which you don't have on the 3.5".

3. The Falcon TOS can handle ~700MB partitions (I might be a little off on this one) Using MagiC or other OSes you can have bigger ones.

Joshua.

There is nothing close to a 700 MB limit. Any limit of this kind has
always to do with a power of 2, i. e. 256, 512 or 1024 MB. For the
Falcon the limit is and always has been 1 GB.

Well, I bought the JAM OUT Pro yesterday (thanks Ken!), and did some
testing last night, and it works very well with Cubase Audio.

And yes, I also tested it with the _DEMO_ version of Audio Tracker
(which only allows you to use busses 1&2 - the FULL VERSION of the
program allows use of all 8). It also worked very well, with no
noises, or any other problems that I could notice.

So it seems to be compatible. I guess I can safely order the full
version of Audio Tracker from SoundPool now.

I am very pleased with what I hear (or maybe I should say what I
don't hear!) so far from the JAM. And by the way, my tests were
done with Un-balanced cables - since I didn't have any balanced cables
readily available at the time. But I'll take care of that little
problem soon enough.

Download it from
http://www.barton.de/atari/download.html

But it's mainly a protocol built into various desktops (jinnee, Thing
and Gemini) for communication with and between applications. From the
Thing HYP:

The AV Protocol was developed for use with Stefan Eissing's
Gemini replacement desktop. Gemini comprised a GUI (Graphical
User Interface) desktop named Venus, and a command line
interpreter called Mupfel. To allow Venus to communicate with
desk accessories the AV Protocol was developed and is widely
supported today. The name derives from:

(AV ~ Accessory <-> Venus)

I suppose the PRG offers these facilities for other desktops etc.

Regards, /Peter/

2704. Disk Images Questions - Emulators

Newsgroup: comp.sys.atari.st
Date: 2001-08-07 21:45:58 UTC
From: neil@adel6.freeserve.co.uk

Source record: 42774

Hi All

After recent troubles with CDRWs, HDs and Scanners it is quite refreshing to be solving the problems, thanks mostly to the posse of helpers on this newsgroup!

I have a new problem though which isn't related to my setup (a sort of remotely located problem) involving ".st" disk images.

A former programmer on the Atari has a software package he wants to put on his website (prompted by my request for it!), unfortunately he seems to have run into technical problems relating to ST emulators on the PC platform. I don't have a PC so can't help him!

He has 2 single sided master disks, the PC cannot read them directly it seems. He managed to get WinSTon and Gemulator from somewhere and using them (I assume) managed to create 2 disk images from the floppies. According to him: he can get them to "run" on WinSTon but not on Gemulator (it seems to want to access actual floppy disks which of course don't exist!).

He would ideally like to combine these two image files into 1 package that can go on a single disk or just a ZIP file for people to use with emulators that can use that.

I would want a ZIP file containing the requisite files to work on Atari systems!

I have the two ".st" files in my possession is there anyway I could access the files on them? Perhaps to convert to "normal" files to make into a ZIP file?

Any suggestions would be welcome.

Thanks for all answers ! It helps me a lot !

Last night, before reading this, I opened my Falcon for the first time and I really wondered how it was possible to connect a IDE drive as there's no power supply ! I did not know 2.5" was supplied by the IDE port itself !

But the IDE ribbon is the same as a 3.5" drive no ? it's just some connectors are not used by 3.5" drive or the IDE adapter differs between 2.5" and 3.5" ?

I think I will first try to connect my Fireball, expecting I would not have as many troubles as with my MegaSTE... So I hope a SCSI external enclosure and the SCSI ribbon for my falcon are not too hard to find.

Uwe, I'm interesting in buying your HDDriver but before I want to be sure my SCSI drive could work on my Falcon, do you think I can use your HDDriver 8 Demo version in order to test it ? Do I need it to format my drive ?

Thanks for all your answers...

2709. Connecting Falcon to LAN

Newsgroup: comp.sys.atari.st
Date: 2001-08-08 07:33:14 UTC
From: toram@thematrix.homeip.net
Message-ID: <a1b9be4e.0108072333.312f6763@posting.google.com>
Source record: 42779

I'm trying to connect my Falcon030 to a LAN. I have it connect to a Linux box with a nullmodem cable. I have pppd up and running, and I can ping my DNS server from the Falcon and vise versa. Only thing is the Falcon can't resolve domain names. it times out! I dumped network traffic to see what is happening when the Atari was trying to resolve:

```
[root@bastion ppp]# /sbin/tcpdump -i ppp1
tcpdump: listening on ppp1
23:51:22.738750 192.168.0.199.1025 > 192.168.0.1.domain: 0+ (45)
23:51:32.738753 192.168.0.199.1025 > 192.168.0.1.domain: 0+ (45)
23:51:42.738751 192.168.0.199.1025 > 192.168.0.1.domain: 0+ (45)
```

as you can see the DNS server didn't answer the Atari, maybe it didn't like it! Any one else have any problems like this. The DNS server is running BIND 8.2.3 BTW. The Atari Falcon030 is running:

MagiC 5.03
NVDI 4.11
STinG 1.26
Latest resolve.stx I could find.

Try a British firm called Fast Forward they have a lot of old BBC stuff. I got Hitchhikes Guide to the Galaxy from them.

Hi ya

If you send both .ST file to me I can convert them into 1 double sided ST file and if you wish a ZIP file too.

Alternatively you could do it yourself.

Briefly you'd need to create a blank double side ST image using Winston. Set up a hard-drive on WinSTon, load your ST image copy the files to the hard-drive then copy them back to the double sided image. Easy to do, hard to explain!!

Anyway quickest option would be to e-mail me the images!!

Hello,

I've just discovered there is Atari ST emulation and tested Steem. And that works pretty much !
So I dreamed of all that good games I have on my Atari ST, and wanted to play with...
but lots of them couldn't be read by my PC (because of disk format...)...

is there any tool that allow to better read a ST Disk with a PC Drive ?
or could I found them on the net ? (I saw bitmap brother have taken their ST games on download on their site)

thank you

Matt'Us

You should have any problem finding the SCSI enclosure or the cable needed but, the prices on SCSI enclosures and cables can sometimes be little pricey. I found that the internal IDE drive was alot cheaper to connect than the SCSI.

Just me 2 cents,

Don

2.5" IDE devices not need an extra power connector.
Power comes thru same flat ribbon as IDE signals.

> are not used by 3.5" drive or the IDE adapter differs between 2.5" and 3.5" ?

2.5" and 3.5" IDE flat wire had an completly different design.
Most of the pinout are compatible, but not in all.

> SCSI ribbon for my falcon are not too hard to find.

Need an SCSI2 to 50pin SCSI cable. Any PC dealer should have it.
(If your drive is in an external case with power supply and 50 pin SCSI
connector)

Yes, the demo is sufficient. You never need to format a drive unless it
has bad sectors.
Note that you cannot format or partition a drive with the demo version.
But HDDRIVER/HDDRUTIL should detect the drive during the ID check.

Mario Bercroft makes (and ASP in the UK sells) an adapter cable to
convert from the miniature 2.5" drive socket to a normal IDE one for
internal drives. It comes complete with a separate power cable that
you have to solder to a suitable place - I soldered mine to the
underside of the power supply board. In theory you could perhaps take
it from the otherwise unused supply pins on the 2.5" socket, but
that's probably more trouble than it is worth!

Regards, /Peter/

Actually the Megafile44 would be usable for scsi drives since the SQ555 syquest drive was a scsi device but that was the only one. The megafile30 & 60 were both RLL, the megafile20 / sh204/205 were mfm. Best electronics does have replacement drive mechs for the whole megafile range in their catalogue. That seems to be the only place that still has any

> Do you recall how the interface boards were set up in those older
> drives?
>

In what way do you mean? I only opened my megafile30 once when I first got it a few months ago used. I had a similar problem, the host adaptor worked but the drive didn't. I did a bit of snooping around inside and did notice strictly RLL only. I've tried the local electronics / computer surplus stores with no luck. Found an MFM drive (which would work in SH204/205).

>

My megafile 30 doesn't seem to have this, its a single board with no scsi support at all. I do remember seeing other similar devices. Emulex even produced an Esdi to scsi adaptor for using esdi drives on a scsi bus.

I think some emulators have disk utilities but it can be a very dubious thing. Many programs on the ST (espeically games with copy protection) use different formats to a typical PC system. Most pc's will choke badly on these. One of the reasons I got out of using emulators. Luckily in my case I have a few ST's around so I'm all set. If you can find one affordable pick up an ST which I call the best "ST emulator"

I'm not the originator of this message, and no, I don't have such a list. But there is one very annoying aspect to MS Works. To my knowledge, there are no other word processors or spreadsheets that can import files saved in the proprietary MS Works formats. True, you can export from MS Works if you know in advance which other program you will be using to work on Works files, and that program is on the list of "save" formats in MS Works. But it's darned inconvenient for people who start out with Works and then want to use something a little more elaborate.

But now we are WAY off topic!

Source record: 42795

The BBS is not down! My ISP (@home) decided to screw up my DNS and telnet. After a couple of weeks of them not figuring out the problem (besides the fact I've told them several times how to fix it :), I've given up. The BBS is now "ssh" based until such time as telnet is restored. ssh is like telnet, but secure.

Since many of you may not know about ssh, the java applet on the bbs website can log into the bbs using ssh *for you*! All you do is go to the website, run the java applet, and enter the userid and password specified. (bbsssh == used to be bbs, now its bbsssh to handle the ssh part).

So the BBS is still up.

Just head on over to:

http://www.skeleton.org/bbsindex.html

for details!

Keep the bbs scene alive!

Excellent answer Ken. The SH 204 is a different beast. Following what
you said, the most crucial with the 302 is to use the older versions
of AHDI that actually came with the 204.

The newer versions will create some of the problems the author
encountered.

Later Brian.

> use and for hobbyists. How would such a system look?

I would go for something very simple: a very compact hand held or palm pilot type machine with a 6502 or 65816 CPU, either 4 or 8 megs of RAM, 320x200 / 640x400 LED display, a GEOS or Palm OS type operation system: it would include both a kernal layer and a GUI layer so that the GUI can be shut down by a program. It would be a machine that could be used for something like a Gameboy
or a Palm Pilot but would include lot of IO ports for external extras like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM, printer ect. and can be used as a simple home computer or web browser as well as a control module for other hobby projects.

I would also include a built in assembler and another simple high level languge like BasicX (which will allow inline asm like Turbo Pascal does).

Oh, yeah... if possible I would also include network support so that these hand held computers can be chained together. Maybe infrared IO too.

A value from 8192 to 16384 should be OK (and safe).
#_BUF 16384

> Task Switch:
> Priority:

Never allow these settings in your MAGX.INF, better let
MagiC Timeslice take care of these. For your system,
a value of 20-25 ms should be fine for Task Switch and
1:20 to 1:32 for Background Priority.

Btw: It's not a good idea to 'push' MagiC into heavy
task-switch with values of 5 or 10 ms, especially on
slower systems or when other programs rely on MagiC's
timer 'thread' (eg internet stacks etc).

> FSL Masks:
>
This depends on the usage of the system, a programmer would
use something like "#_FSL 0 *.C,*.H; *.S etc", others
might use "... 0 *.APP,*.PRG;*.JPG,*.GIF,*.IMG;*.DBF,*.IDX"
etc, etc. (every ';' starts a new line).

Hmm, and a final tip: Make sure your #d line contains enough
spaces, better terminated with the ";" to avoid editors that
remove trailing spaces to compact it in the feauture.
I'm not sure if it causes problems in the newer MagiC versions,
but it was definitely a headache in the past.

> I would go for something very simple: a very compact hand held or palm
> pilot type machine with a 6502 or 65816 CPU,

Or for $10 more, you could have a 200MHz StrongARM processor or similar in the device, along with easy, cheap support for the interfaces you list below.

I like ARM processors, and really want a fast XScale based laptop or computer. Not much chance of getting one soon though.

> either 4 or 8 megs of RAM,

For a handheld device, low power memory is essential. Hitachi just this week released an 8MB memory chip that uses 30% less power and is even faster. Given the cost of memory, it makes sense to hit the sweet spot in price rather than the cheap spot, and I imagine that could be 16MB or 32MB. Which is a lot for a handheld device unless you run WinCE. Which I wouldn't want at all. So lets spoil ourselves anyway.

> 320x200 / 640x400 LED display,

If you have a keyboard on the device (like a Psion palmtop) then a 640x240 half-height display (Psion 5) or 640x480 display (Psion 7) would be great.

Without a keyboard you would have a conventional palmtop display of 320x240.

> a GEOS or Palm OS type operation
> system: it would include both a kernal layer and a GUI layer so that
> the GUI can be shut down by a program. It would be a machine that
> could be used for something like a Gameboy

Palm do have a very good frontend for launching software on a palmtop device. The software choice is very good as well. The underlying OS is a bit didgy though, but they are moving to ARM, so hopefully they will sort these things out and get a solid OS in there under their GUI stuff.

> or a Palm Pilot but would include lot of IO ports for external extras
> like keyboard, mouse, TV/VGA output, disk drive, hard drive or CD-ROM,
> printer ect. and can be used as a simple home computer or web browser
> as well as a control module for other hobby projects.

Yikes, where to put the ports on the device! I suppose it could have one of those laptop bay-extender thingies, which could have a DVD/CD drive, HD, etc in it.

Wireless ethernet would be a very useful feature.

Mouse wouldn't be necessary with a touch-screen system. A small portable printer for the device would be neat though - an A5 printer :) Still "neat" is not "needed"! Audio recording and playing is necessary, as is decent video, which palmtops really need. How about some 80's style graphics hardware trickery! Sprites, hardware scrolling, block mode graphics, etc, but with a 16-bit screen :) - then again, the GameBoy Advance has that and more now... maybe some lowend 3D hardware instead!

> I would also include a built in assembler and another simple high
> level languge like BasicX (which will allow inline asm like Turbo
> Pascal does).

That would be fun.

Graham

Should be no problem. I've used several NECs without any problem. The one
that you have looks to be pretty standard.

Joshua.

I'm not sure either but I believe the MiNT kernel has something to do with it. I'm a MiNT-user since very long time. I've tried almost every new kernel. I must say Wensuite has always worked for me but with older kernels (<1.15.9) Wensuite did create a nameless dir which couldn't be deleted except with a diskeditor like Diskus.
>
>I am currently running version 3.30b and it looks rather nice.

The browser part is very quick indeed. It's the fatest Atari browser currently available. Much faster then Cab and Adamas. It's also very stable. It has some problems to display animated gifs. Furthermore the display of the pages aren't always correct.
The login part is a different story. I know some guys who never could make a connection with their ISP using Wensuite. Myself have tried it with three different ISP's. With one I didn't encounter a loging problem. The other two were no usable with Wensuite.
The News and mailer part contains IMHO lots of bugs. The wordwrap for instance isn't good at all.
AFAIK, the developement of Wensuite is stopped. A year ago the programmer said he would release it as open source, but so far no sign of that.

A few days ago I upgraded my Milan to Mint 1.15.12

This may or may not be the cause but I have now found that
Wensuite will load and run !

I am currently running version 3.30b and it looks rather nice.
It certainly seems to be quick. I have only had it running
for a few minutes so I don't know too much about it. It
works offline only.

Previously Wensuite would crash my Milan completely and
several others on this group had reported similar experiences
with Milans and TT's.

The only other thing that I have changed was the fix to the
scsi/soundblaster firmware problem but I don't think that
was the cause of the Wensuite problem but you never know.

Jeff,

Your BBS is great! However, "the Worlds only

online Atari ST BBS" may be a bit of a misnomer.

The JYBOLAC Stargate BBS is still up and running and going

strong. Granted this is not a "classic" ST BBS, but a new

one running on a real connected TT030 running Linux. Okay,

so maybe I have the worlds only online Atari TT030 BBS,

but....

Anyway, several games to be played, local discussion

board and realtime chat with other users that are logged

in at the same time.

You can log in here: telnet://jybolac.dyndns.org:520

More info here: http://jybolac.virtualave.net/bbs

Hi! I just got an Atari STacy2 and want to play around with it. I have some questions and hopefully some kind souls in this group can point me in the right direction.

1) Where is the latest FAQ (full version) being held hostage?

2) What are the best Atari ST information sites? Site that will make recommendations on what desktop goodies I should be running... and recommendations on good freeware and shareware apps.

3) When it comes time to power down an Atari ST based computer, is there a command like "shut down", like the PC's and Macs require? Or can I just flip the
power switch off?

Thanks!!!

Hello Bob,

What was the 260ST?

I have never encountered it before.

I have to say that web sites etc which "support" Atari but won't actually work
with an Atari aren't exactly useful!

FamilyNet Newsgate

A 520 ST back when Atari thought 260K (or there abouts) would be enough for
a 16 bit machine (Bahahahahahah!!!)

You know, just as bad as the first Macintosh's having 128K and quickly
realizing how underpowered that was. ;) I used one for a bit and quickly
clammored to get the 512K upgrade.

2757. [ANN] New software for Atari

Newsgroup: comp.sys.atari.st
Date: 2001-08-10 12:12:26 UTC
From: Patrice Mandin <pmandin@fr.mailandnews.com>
Message-ID: <a3j0l9.pd1.ln@127.0.0.1>
Source record: 42725

Hello everybody,
I did not post any messages for a long time, so here it is:

pmdoom-0.27: you can store parameters in a file, to pass it on the
command line. You can also play doom in a GEM window.

fetchmail-5.8.5: Retrieves mail from your ISP, and put them in the Unix
mailbox.

leafnode-1.9.14: Local news server, retrieves new messages when you
connect, and send your queued posts.

wwwoffle-2.5b: http/ftp proxy, caches all requests, can be used as ad
filter if you want.

I think these will be useful for people using MiNT to access Internet.

Message-ID: <uWVc7.26311$Vs4.263719@zonnet-reader-1>
Source record: 42731

I have a ramdisk on drive R: installed with MiNT 1.15.12 using the line "alias r: u:\ram" in the mint.cnf file and a drive R icon on my desktop.

If I open the drive-R-window and copy a file to it or delete or rename a file the results of these actions are not directly visible in the window. Only if I hit the Escape key the window content is correctly updated. (Or if I close and re-open the window). Is this normal or have herr F.Naumann & friends forgotten something?

Now that you mention it... Yes, I've noticed this too, and I think it's
been like that for ages.

> updated. (Or if I close and re-open the window). Is this normal or
> have herr F.Naumann & friends forgotten something?

I've been neglecting my Falcon the last year, so I'm not as updated as I
used to be, but I don't think this is normal behaviour.

I'm using Modem 2 I think the Falcon030 only has 1 serial port, but I
don't know why its called Modem 2. I don't have HSMODEM in my auto
folder, but I have SCC.PRG and DRVIN.PRG here is the order of my auto
folder:

MAGXBO32.PRG
NVDI.PRG
DRVIN.PRG
SCC.PRG
STING.PRG
STING.INF
RASNAUTO.PRG
DAWNAUTO.PRG
ALICE.PRG
WDIALOG.PRG

This is from AUTOSORT.PRG

Hello,
Doesn't this software support the Umax Astra SCSI scanners too ?
I'd like to buy it but Homa Systems seems to be in coma. Recently I
came across a Homa Systems site (don't have the url anymore,
something with the word " CAB" but there was no link or email
adress on that site.
Recently there was a message on http://www.st-computer.net
A computer shop had a bunch of Umax Astra SCSI scanners for sale.
For the drivers for Atari one could contact the publisher of STC
it was said. I emailed them yesterday about it. As soon as I have an
answer I'll let you know.

Cheers
Dan

The 260ST was Atari's first model in the ST line.

At the time, memory was EXTREMELY expensive, and they wanted to keep
the cost of their new computer line as low as possible, so the first
one was going to have 256K of RAM in it.

(Atari liked to "round up" the amount of RAM into the model number.
Thus the 512K Atari 520ST, and the 1024K Atari 1040ST.)

Anyway, by the time they actually introduced the ST computer line,
they had realized that 256K simply wasn't going to be enough RAM to do
anything useful, and dropped the idea. The first model introduced in
the US was the 520ST.

Actually, they DID sell a few 260STs in Europe, probably just to get
rid of the ones they'd started to make. Those would probably be
"collectors" items if you could find one today!

A somewhat funny thing about the 260ST is that when the ST line was
introduced, the Operating System, TOS, wasn't ready to be released
yet, so there were no TOS ROMs available to be installed in those
first computers.

You had to load the version of TOS they did have from a floppy disk,
which meant it was loaded into the system RAM.

The poor little 260ST I saw at the Consumer Electronics Show in
Chicago didn't have enough memory to do ANYTHING after TOS had been
loaded from the floppy. They were using the 520ST to do all the
demos.

Just a dusty footnote in the lost archives of Atari history...

Not sure if the Stacy has any specific needs, but a "normal" ST can be
shut down by yanking the power cord out of the wall. (Probably not
really recommended, but for other reasons.)

No "shutdown" is required.

(Just be sure to SAVE anything you've been working on before hitting
the OFF button.)

Well for your stacey running Tos/Gem (the normal ST os) just shut it off, no
other stuff required. Only if you have an 030 (or better) based atari with say
linux or unix do you need the shutdown routine.

Hello,

How would one connect a 6 channel stereo mixer with 1/4" phone jacks
to a Falcon? (1/4" phone out)
(The mixer has a very "hot signal")
Do you need to have additional hardware like soundpool or lineaudio
or can you go direct?
I would like to record an acoustic instrument using Logic Audio.

thank you

ken

I think it was Sam Tramiels idea from when he was at Commodore that model numbers match memory size. The 400 and 800 from 1979 originally had 4k and 8k RAM in 1979, but they'd grown somewhat, so that the name didn't identify RAM size when Mr Tramiel took over in 1984.

An 8 bit machine with 64k (65536 bytes) was a 65XE
An 8 bit machine with 128k (131072 bytes) was a 130XE.

(There may have been a smaller 8-bit in the XE range, but I cannot recall seeing one in 1985/1986)

The ST was supposed to start with 128k RAM as well, and so would be called a 130ST (131072 bytes = 128k), and went up from there: 260ST (262144 = 256k), 520ST (524288 = 512k) and 1040ST (1048576 = 1024k = 1M)

But, as you say, the fact that the OS consumed so much RAM meant that the 130ST was killed before birth, and the 260ST was abandoned.

As you can see, the model numbers doubled as the memory size doubled.

Source record: 42646

Hi All,
I'm getting the message 68000 Exception error 69 every so often
then a partial crash. The screen does'nt freeze but the system won't
run any programs (including Shutdown). I just get bombed!
INF: Falcon/Magic 6/HDDriver7.
Booting with MGXB032 followed by MAGTOROM then NVDI5, SAM, etc.

Any thoughts?
John G.

My MagiCMac runs, but it that GEM enough ? Ok maybe yes, tought I hardly see
how I could test the installation then, on the Mac at least. MacMiNT runs
GEM/AES ?

Yes this is what I asked, does the installer work with MacMint ? I can do the
testing then, or even adapt MacMint, I have the MacMint base installation,
but I am not able to find all other necessary files, so I've never seen GEM
on it , is it working ?

Hi,

> There's already a MacMiNT available!
O.K, but MiNT is not GEM and I doni¿½t know how MacMiNT works, because I have no Mac. The installation is based on Sparemint packages, so, question is, if programs compiled for Atari MiNT are running on MacMiNT without recompiling them?

Ciao

I have trouble connecting to ftp://chapelie.rma.ac.be
Didn't have any problems in the past, but now I'm getting "EOF from
remote" and "Server access denied" with NEWSie. (Can't connect with
aFTP either by the way). No problems with other servers I'm visiting.

Has something changed that I should know of?

There is nothing changed so don't trown away your ftp-clients like some
French guys has done:-)
The server is still up and running *but* for some reason (probably
someone has closed the ftp-port) the server is unreachable. Even Karl
Samyn and I can't get in. Karl has tried to contact the webmaster but so
far no luck. I hope the webmaster will appears very soon. I've already
lots of stuff waiting to be uploaded. If you search something let me
know. Just before the server went unreachable I've make a copy of it on
a CD.

Hi, as I am still running my BBS system under MagiCMac, I am still interested in MacMiNT and other Atari and fido/internet related software. Are you still supporting/developing MacMiNT ? I actually have almost all the sources of the software of my BBS/FTN/internet system, so I can still manage to adapt it to keep it current, I can help you about:
- Atari GEM NOS
- Jetmail
- Octopus
- Semper
- LED

The only piece of software I do not have control yet is the OS itself, MagiCMac is good but I would prefer to put my hands on a MiNT like project, so I wonder if MacMint can be used to run GEM programs (with what AES ?) and to drive serial ports and other Mac hardware.

I downloaded the MacMint sources and basic installation, but I was unable to find all other installation packages, as none of the link in the MacMint web page does work, where can I find the needed:
(MacMiNT archive)
futilb.zoo

(Atari archive)
Gnustuff/Tos/Othergnu/shlutl18.zoo
Gnustuff/Tos/Othergnu/gzip107st.zoo
Mint/Utilities/tar-1112.zoo

???

Am I wrong at all trying to follow this project or what ?

2786. Re: 8-bit Atari's: monitors: were there any????

Newsgroup: comp.sys.atari.st
Date: 2001-08-11 14:17:08 UTC
From: Glenn Bruner <brunergs@pcisys.net>
Message-ID: <3B753E64.40245442@pcisys.net>
Source record: 42655
Cross-posted to: alt.atari,comp.sys.atari.st,comp.sys.atari.st.tech

To get back on topic, yes there was one found.

Atari had made a composite video monitor for the 8bit line of computers.

I was with John Hardie in 1994 when we visited San Jose Computer's (went out business a long time ago). San Jose Computers was in the Atari business in the Valley for sometime along with B&C and Best.

John found there a prototype of a 8bit computer monitor. Didn't know if it worked or not. But he bought it for, if I remember right, $20.

At the time, John was buying so much stuff that he didn't have the money to ship it back. So he asked Mike Hohman of Fine Tooned Engineering (fTE) to ship it back. Well that never happen. Mike put it in storage and later disappeared.

News later is that the storage unit that Mike had was opened up by the owner and all the property sold off. Another 8bit collector had purchased the monitor (found this out at World of Atari '98 show). There were a lot of people who lost their stuff in that property sale.

So yes, an Atari made 8bit composite video monitor does exist and is now in a collectors collection.

And now you know the rest of the story...

I have various copies of .DOC files that came out of Atari.

Most of them are like Engineering Change Orders (ECO's) and they used
some sort of DTP or Word processor to save these files with.

Does anyone know what programs saved their files with a .DOC extender?

Glenn

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to ffmh@netzero.net or for
more info.

My want list is near the bottom of this list.

HARDWARE

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured
word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

The Complete Atari MINT CD by Whiteline. Everything you could ever
want/need with MINT for your Atari computer. X11, PERL, HUGE, TCL,
GNU C++, MINTos, MINTnet, FTP, Telnet, and all the MINT Distribution
kits. Over 330 Meg of data. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

Word Plus 5 by No Software (v 5.04, 1995) saves also with a .doc
extender. Word Plus 5 can load 1st Word Plus docs but not the other
around. Word Plus 5 doc can't be loaded in 1st Word plus.

Arnor's ProText also does. At least the old version 4.22 uses it. I
don't know about the newer versions.

Would anyone know where a copy of version 4.22 might be found? I own this version, and the Convert program has gone bad on the program floppy. I'd like to find someone who could email me just the convert.prg program from disk 3.

Thanks.

Hi,

> How would one connect a 6 channel stereo mixer with 1/4" phone jacks
> to a Falcon? (1/4" phone out)

Simple cables with converters between the sizes would do nicely... ;)
The adapters are standard and can be found in any store that sells
hifi-equipment.

> (The mixer has a very "hot signal")
> Do you need to have additional hardware like soundpool or lineaudio
> or can you go direct?

Ok - check out my website, the troubleshooting section - and you'll find the
necessary modifications to get standard line levels in and out - instead of
the original mic in and headphone out...

> I would like to record an acoustic instrument using Logic Audio.

I know some people who never got Logic Audio for Falcon to work properly
(who eventually changed to Cubase instead). I'd suggest that you take a look
at Cubase Audio, which works very well.

Best regards,
Claes

May it be the same old problem that I fixed with a special option in NOS ?
from the readme of v0.50:

- new command to test ftp problems of Bruno Kozlowski:
"tcp precedence [ON|OFF]"

This solved the problem AFAIK and tested by Bruno at chapelie.

Ah NOS. Those were the days.
>
>- new command to test ftp problems of Bruno Kozlowski:
>"tcp precedence [ON|OFF]"
>
>This solved the problem AFAIK and tested by Bruno at chapelie.

This was not the same problem. IIRC that problem had something to do with
the fact that Belnet (compagny who leased out the line to chapelie) was
using a non-RFC comform setup. Users of Sting (tcp.stx <v1.21) were unable
to log in. See tcp_stx.txt (STing documentation) section TCP.STX 1.21
At that time only STing and NOS users were having problems. MiNT-net users
and pc-users didn't had any probs to reach the Chapelie.
Now everyone, regardless the platform or TCP/IP stack they are using are
unable to reach the server. For my it looks like someone has closed the
FTP-port. A ping reveals me the server is still up and running.
The main problem is that the webmaster is a student and as the school in
Belgium hasn't begin yet it's very lickely he's sitting somewhere on a
exotic beach. There is nothing that we (Karl and I) can do about this
right now. All we can do is just sit and wait until the webmaster popup
again.
Until then you can always mail me if you search something. I've a full
back-up of the server on CD.

Ciao,
Martin

Jaguar Corner at the Ohio Atari Swap Meet

August 8, 2001

Columbus, Ohio - Come join us for fun and games at the Atari Computer Enthusiasts of Columbus
annual Atari Swap Meet to be held on September 8, 2001. This annual event boasts a wide
selection of Atari games and systems for sale. Last year the event had many items available
for the Atari ST, 8 Bit computers, 5200, 7800, and 2600.

This year, the Jaguar Corner will be at the Swap Meet. The Jaguar Corner is your chance
to play the most popular and rare games available for the Atari Jaguar video game console.

Featured games available for view and play are:

- New games from Songbird Productions (http://songbird.atari.net/) including Skyhammer,
Protector, Hyper Force, and Soccer Kid for the Jaguar; and Lexis, Championship Rally,
PONX, Remnant, and more for the Lynx.

- Doom and Air Cars in 2 Player, 2 Console Network Play

- BattleSphere from Scatologic (www.scatologic.com) available for play and demo

- Jaguar CD with games such as Primal Rage, Vid Grid, Blue Lightning, Battlemorph, and
World Tour Racing

- Popular Jaguar games such as Towers II, Worms, Zero 5, Defender 2000, Atari Karts, and
Breakout 2000

- JUGS (www.buyjugs.com - The Jaguar Underground Game Server) which allows the downloading
of underground, homebrew games into the Jaguar. Underground games available for play
include Asteroids, Gorf demo, Jagmania, Jag Tetris, and Native.

The Jaguar corner is being promoted by Fred Horvat (fmh@netzero.net) and Brian Gentile (mail@addie.cjb.net) of Addie's Atari Page (www.addie.cjb.net).

The Atari Swap Meet is being run and promoted by the Atari Computer Enthusiasts of
Columbus (http://www.angelfire.com/oh4/acec/acec.html).

The Atari Swap Meet and the Jaguar Corner will be held from 9:00 am to 3:00 pm on
September 8, 2001 at:

Oakland Park Community Building
980 Lenore St.
Columbus, Ohio 43224-3351

Directions: From I-71, take the E. North Broadway Street exit east, turn left onto
Maize Road, and a quick right on Lenore Avenue.
Admission: The price of admission to the Atari Swap Meet is $4 per person and $6 per vendor
table (includes one admission). The Jaguar Corner costs nothing!

For the latest details on the Jaguar Corner, see Addie's Atari Page (www.addie.cjb.net).

Most probably First Word of 1st Word Plus. Look at them in any text
editor. If they have something like:

```
06000000000000012000000000000000
10
20
F0110000001
9[.............................#..........#.....................]2010
```

at the start then they are definitely 1WP in word processing mode.

On the Atari there are programs to convert the files to ASCII. If
you no longer have one, you can load the file into any text
editor, remove the above heading and then do a search for ASCII
characters 029 and 030, which 1WP uses a stretch spaces, and
replace them with normal spaces (032). And remove any two-letter
combinations starting with 'Esc' - these will be styles (italic,
bold etc) and form feeds.

Regards, /Peter/

Ken,

A few Mark X Ataris were modified for line input, but all standard
ones only have a mike level input mini-jack. You could either see if
the mixer has a mike level output (unlikely but possible) or you
can make up an attenuator pad; this would have to be quite a high
value - around 60 dB or 1000:1, perhaps a little less - which
could lead to some loss of high frequencies, specially with a long
connection cable.

Regards, /Peter/

Anyone out there still have a copy of this program, version 1.1? I'm going through my old Atari software to see if it still works, and the PRG and OVL files on my disks have gone bad, apparently.

I'd like to know if anyone is willing to email these two files to me.

This is not pirated stuff, I own the real thing. Would gladly send a scan of the manual (any page) or floppy disks if you wish.

Thanks.

Do you have the e-mail address of Pascal Barlier? I would like to ask
him to release Wensuite as open source like he has promished to do a
year ago.
>
>So I guess you'll definitely have to forget the development of this piece

If that piece of soft would be released as open source some guys could
take over the development. I do believe Wensuite would be a good
starting point for a better and faster Atari-browser.

Hi,

I have a small plastic connector holding a colourful ribboncable in place
on my ab040 board, it goes from underneath the board and fits right
between the 2 "connectthru" things for the expansionport. This prevents my
NOVAadaptor to fit 100%, it takes alot of fiddling around to get it
working once it slides out of place.
Does anybody know what this ribboncable is for? Apparently it only exists
on some boards, not all.

cheers!

/Fredrik

->a track - which can be easily CUT out), and seems very stable.
->However, e-mails to the authors either don't go through, or are
->unanswered. And I'm no longer able to find any information about this
->program on the web (except for an old review or two), and without a
->manual, many of it's features and functions remain a mystery to me.
->And I've no idea how good it's multitrack capabilities are since this
->feature is disabled in the version I have. Does anyone know anything
->more about this program? Is the commercial version still available?
->Anyone have it?

no idea. I don't think it is developed anymore. I have tried it,
but was sticking to v-trax by the same authors. I have translated the
french manual to english(was rough, is usable now, will be polished in
the future). v-trax is freeware, studio son may still be shareware.

->I've also tried QUiNCY, but is not useful to me as I need to record
->through the FDI.
->Is there _any other_ multitrack/digital recording software for the
->Falcon that does at least 8 tracks, can utilize the FDI for recording,
->and doesn't suffer from these BUGS in Cubase Audio? (an additional
->plus would be the ability to also playback MIDI in sync with the
->recorded audio tracks).

I don't find nemesis useful as studio son or v-trax will not work
unless nemesis is turned off. you experience may be different.

Protext and Pagestream both allow you to choose the extender, which has no universal meaning.

If you can open your file in a plain editor (eg, Edhak) and it shows many header lines (such as: >li, >od, etc - I made these up, because I can't remember actual examples) with plain text lines, then it is a Protext doc. Otherwise, there are many progs that can also use the .doc extension (like PageStream) willy-nilly. Pagestream and Protext docs can be read in EdHak, but you must remove all the extra control and format characters.

Charles.

I would like to know where v 5.xx can be found!! I paid a cheque to someone whose name and address I have lost; I have had no response at all and have lost my notes on their address. I would be grateful if you would join me in tracking down the two sites involved: one is in Glasgow, the other (the supplier, to whom cheques are to be sent) in some other place which I have forgotten and have no note of (they cashed my cheque, nevertheless).

Now that someone else is involved, my hopes are elevated.

Charles.

The Scotland location wouldn't have been Floppyshop, would it? They
closed up quite awhile ago.

I don't know about the supplier.

> Now that someone else is involved, my hopes are elevated.

I'm not looking to upgrade the software, just to get the one bad file so
I can sell my copy. It looks like quite a sophisticated word processor
for the old ST and Mega computers.

Hi Ken

I believe I have this program. Very colourful binder? Like Hot pink or
something. Anyways, as soon as I get back home, to where my STs are, I
will send you the required files. I am just trying to clear up a few
hardware problems myself at the moment, so just be patient.

Later Brian.

Well, not hot pink! <G> Mine is white hardboard over a spiral type
binding glued to the read cover. But it does have a rather "artsy"
rainbow bar along the edge of the outside cover. I could scan the cover
and email to you if you'd like.

Well, CSS isn't as crucial as other types of web info. CAB can easily display a page that uses CSS. It just won't be as nice looking. But it can still be displayed.

Ok problem solved. The files were Pagestream files.

Initially when I opened them, I couldn't see any text. But once I situated the settings for the FONTS and DOC and GRAPHIC directories, everything work out fine. In fact I'm using TOSBOX on my PC running TOS 2.06 and printing the documents out to my Apple Laserwriter 360. Hey what can I say! It works!!

Thanks for all your help.

This cable is present on all Afterburners AFAIK. To avoid conflict
with the Nova (or any other expansion card), replace the connector on
the AB with one angled 90 degrees. I've done this on my AB, and both
my Nova and Eclipse fits without problems.

Ok, i'll see if i can try to find a replacement, its a pain in the bum
really since i cant put my MKXcase back together without getting
novaproblems (which i assume comes from the adaptor not being in
place).

cheers!

Fredrik.

There is almost no limit to the *drive* size, but even with
MagiC you can't have any partitions larger than 1 GB. And of
course you are restricted by the number of partitions you can
have, which depends on the OS. From Uwe's help-text for HDDRIVER
(the best hard disk driver there is!):

Partitioning Limits
TOS 1.00-1.02: 256 MByte
TOS 1.04-3.0x: 512 MByte
TOS 4.0x: 1 GByte
MagiC, MiNT: 1 GByte, 2 GByte if DOS compatible
(Note: DOS compatible formats can only have 1 partition)

Number of Partitions:
TOS: 14 (C:-P:)
MagiC: 23 (C:-Z: except U:)
MiNT: 29 (C:-Z: except U:, 1:-6:)

So with MagiC you could have 21 GB, with MiNT even 27 GB (two
drives are reserved for floppies), or 1GB less if you are also
using a CD-ROM.

Personally I have a 6.4 GB IBM fitted internally. This is a 3.5"
drive with a suitable cable adapter from ASP. One snag with these
large drives and partitions (mine are some 840 MB, except for C:)
is that the cluster size is 32 kB, so every file will use at least
that amount of space, even if it is only 1 byte long!

Regards, /Peter/

On Sun, 12 Aug 2001 22:00:49 GMT, anarkist@idirect.com (Ken Macdonald) wrote (regarding STUDIO SON and availability):

>no idea. I don't think it is developed anymore. I have tried it,
>but was sticking to v-trax by the same authors. I have translated the
>french manual to english(was rough, is usable now, will be polished in
>the future). v-trax is freeware, studio son may still be shareware.

Actually, what happened (as far as I can tell - having downloaded and tried all 3 programs) is that the original version of STUDIO SON, was essentially what later became V-Trax. The current version of STUDIO SON is more or less just a 2 track audio file editing program. The original version had the multiple tracks of V-TRAX, (although they were disabled in the version I had).

Basically they took the original STUDIO SON, and split it into two different programs (V-TRAX and STUDIO SON), adding to the confusion by keeping the STUDIO SON name for the second version.

And by the way, I'd love to get a copy of the ENGLISH manual when it's ready!

>I don't find nemesis useful as studio son or v-trax will not work
>unless nemesis is turned off. you experience may be different.

Actually, the original STUDIO SON _required_ an accelerated Falcon (they say it requires a Centurbo, but it works great with the Nemesis in my Falcon). It was more or less unuseable with the Nemesis turned off. And I've tested V-TRAX on my Nemesized-Falcon and it also works, but I can't seem to get it to recognize the FDI as the input.

>me too! :-)
>I have Logic Audio 2.01B, but can't find a manual/book for it.

I've gotten some suggestions from some helpful folks about things to try to get Cubase Audio to work better on my Falcon. I'll start another thread about that soon.

In the mean time, having picked up a used JAM 8 OUT Pro, I'm pretty sure I'm going to get the full version of SoundPool's AUDIO TRACKER, as the demo really impressed me.

2837. Cubase Audio Troubles - Is it just me?!?

Newsgroup: comp.sys.atari.st
Date: 2001-08-14 01:51:56 UTC
From: nurmix@spam-free.com
Message-ID: <3b787ac9.1956016@news-server.socal.rr.com>
Source record: 42558

Ok, here we go...

Many of you will know that I've posted about Cubase Audio (CAF) in the past. Basically, I normally use it for just MIDI work, but I've been working on some projects that require _a lot_ of vocals, and CAF has been giving me a lot of trouble with random POPS and CLICKS in the recorded tracks, and I've been getting some conflicting bits of advice from people, so I thought I'd run it past everyone here, to get more input.

To start off, I'll tell you that I have a 14MB Falcon, that has had the "audio modifications" (for better CAF performance) done long ago, and it also has the Nemesis accelerator installed (that includes a "buffer board" that is apparently also supposed to help with CAF problems). The audio gets to the Falcon [through my TASCAM DAT machine] via the SoundPool/Steinberg FDI. And recently, I've also connected the JAM OUT PRO (rackmount - 8 outputs with 18-bit D/A converters) for a nice clean ouput signal. Also, I use a 4.29GIG Seagate "Barracuda" SCSI hard drive, with several completely empty partitions that are used fresh for each song.

My Falcon works great in all other areas, and with other digital audio applications that I have tried (QUiNCY, Studio Son, V-Trax, Audio Tracker). There are no noise problems with these programs. And my Falcon also works well under MagiC 5, and I've used both HD Driver 7.61, and ICD Por 6.5.5.

Now, onto the CAF problems:

* (1) *

Try as I might, I _cannot_ use HD Driver with CAF. Whenever I run CAF under HD Driver (I also run the little CAF_FIX.PRG too), here's what happens. I select a track to record audio on, name the file, click OK, then a short pause, and BOOOOOM, multiple bombs (like 7 or 8), and an immediate crash to the desktop. This happens 98 out of 100 times whenever I try to record audio. MIDI works ok though. I have no idea what this is all about, as everyone tells me they use HD Driver with CAF and never have problems - and I belive them. Uwe???

Well, since HD Driver is the driver I use when I'm doing _anything_ else on the Falcon, I've set up a floppy that I can boot from, that loads the ICD Pro drivers instead. When running CAF under ICD Pro, I don't get these crashes. But the random pops and clicks still appear.

* (2) *

Many of you, I would think, know Alex at ATY Computer in Oakland California, USA. Well, I consider him an expert with the Falcon and it's problems. I've dealt with him in the past, and in fact, he is the one who installed my Nemesis board a couple of years ago. He suggested that I should use the original Atari hard disk driver (AHDI v 6.05). He said he hasn't had noise problems when using that driver, that he DOES have under HD Driver or ICD Pro. I haven't tested it yet, but am planning to.

* (3) *

Despite the fact that I thought otherwise, based on what many people HERE have told me, Alex informed me that these noise problems are NOT related to the Falcon "clock/timing" fixes. He told me the following:

[from Alex at ATY Computer]:

"Your Falcon does not need any more "fixes". The buffer card portion (that little 1"x 3/4" circuit board that was installed underneath the keyboard in the middle section of the Falcon) of the Nemesis installation replaces all other CPU clock signal modifications. In fact it is the BEST modification to stablize the Falcon"

"I have repaired several Falcons with stability problems by simply installing the buffer card portion of the Nemesis. The documentation that came with the Nemesis also mentioned that this buffer card fix is very stable"

* (4) *

Alex also mentioned a few other things to try, like using a different SCSI cable or drive (which I have), and also turning OFF the Falcon's internal fan. He had this to say about it:

[from Alex at ATY Computer]:

"It might sound strange but some Falcon fans actually can't keep a constant speed particularly after they have accumulated enough dust on them. The irregular spinning actually feeds back a clipped sine wave interference back onto the power supply which in turn causes slight delay in the voltage regulation timing. I was studying this problem with Atari way back in 1995 when one of my customers complained about a similar problem. I took the Falcon, SCSI hard drive, and Cubase Audio to the Atari service center in Sunnyvale. We setup the system and attached a scope to the 5 volt power line. By pressing down on the fan to similate the irregular spinning the sine wave changed and Cubase crashed while it was recording. We couldn't confidently conclude that a bad fan will always cause Cubase to malfunction because we pulled an other Falcon out from the warehouse and tried the same test. The new Falcon didn't crash Cubase but this fan thing had always stuck in the back of my mind"

* (5) *

And finally, it was suggested to me by another Falcon/Nemesis/CAF user (Wayne Martz) that fragmentation will eventually cause noise problems, even if you start with a clean and completely empty partition. However, he told me that if, after hearing the noise, you quit CAF, and do a defrag on the partiton, then restart CAF and reload the song (the drive now defragmented), the noise _won't_ be there. I haven't yet tested this myself yet, but it sounds promising.

Anyway, that's all I can think of at the moment, I welcome any and all replies! Let's figure this thing out already!

So, the Atari ST's use in music and MIDI is well known, but what about its brief period of superiority in the graphics arena before the Amiga?

I'd like to make an archive of Tom Hudson and Darrel Anderson art, as well as anything Cyber Studio related.

In particular, I'd love to copies of all the old CAD3D model disks, for use in some retro 3D...

Can anyone help? I've been able to find very little on the 'net Cyber Studio related, however I did manage to grab an mpg of the Dire Straights Money for Nothing video thanks to Morpheus...

Seems Darrel Anderson is still around, http://www.braid.com/ However Tom Hudson seems to have disappeared into obscurity ages ago and hasn't been seen since.

Amazing. I used to spend all day leeching off of umich at 2400bps. Now I just mirrored the entire games and demos directory in under 10 minutes...

What other Atari ST archives are still around these days?

2839. @@@ VINTAGE COMPUTER FESTIVAL 5.0 @@@

Vintage Computer Festival 5.0
September 15th and 16th, 2001
Parkside Hall - San Jose Convention Center
San Jose, California
http://www.vintage.org/2001/main/

Mark your calendar! The fifth annual Vintage Computer Festival is scheduled for the weekend of September 15th and 16th at Parkside Hall in San Jose, California.

The Vintage Computer Festival is a celebration of computers and their history. The event features speakers, a vintage computer exhibition, and a vintage computer marketplace. We showcase all different types of computers for all differents kinds of platforms in all different shapes and sizes.

EXHIBIT YOUR VINTAGE COMPUTER

Vintage Computer Collectors: we want you! Exhibit your favorite computer in the Vintage Computer Exhibition. First, Second and Third place prizes will be awarded in 13 categories, including the coveted Best of Show.

For complete details on the VCF 5.0 Exhibition, visit:

http://www.vintage.org/2001/main/exhibit.php

BUY/SELL/TRADE AT THE VINTAGE COMPUTER MARKETPLACE

Do you have some vintage computer items you'd like to sell? Whether you rent a booth or sell on consignment, the Vintage Computer Festival Marketplace is the premier venue for selling old computers and related items. If you would like to rent a booth or inquire about consignment rates, please send e-mail to <vendor@vintage.org> for more information or visit:

http://www.vintage.org/2001/main/vendor.php

TELL A FRIEND! TELL A FRIEND! TELL A FRIEND!

We really hope to see you at the VCF 5.0! And remember, tell your friends!!

A printable flyer in Word format can be downloaded here:

Last I'd heard of Tom Hudson, he was working for the Star Trek Deep
Space Nine production company, building detailed models and gadgets
for the show. Haven't heard anything for a long time though.

Every now and then one of the old familiar Atari pics will pop up as a
.JPG among everything on the PC sites. They're never identified as to
their origins, but a lot of them are unmistakable.

I wonder if any of the UK Atari CDs have anything you could use on
them...?

See my other posting: Since you can have FAT32 partitions with MagiC you
can even create a single 128 GB partition. The situation is similar with
MiNT, where you can use FAT32 and ext2fs partitions.
Also note that with HDDRIVER the drives A: and B: are not reserved for
the floppies.

I bought some connectors from ELFA, it's standard 1/10" connectors
which you cut to the length you need. I think one of these is what you
need: http://www.elfa.se/elfa/produkter/se/14/146781.htm

Message-ID: <3B78D99C.307E715E@siemens.at>
Source record: 42565

Hi all,

Since Paul Nurminen in his latest posting mentioned problems caused by
the Falcon internal fan, this motivates me to ask here about some other
fan related problems that annoy me.
I have a CT2 too and it's fan is not very firmly attached and very
loud. Since among other things I like to record music using some
microphones the noises of both fans are very disturbing.
Are there any better solutions where I could get rid of both fans
ideally, and maybe get some big, temperature regulated fan ?
Or are there even better solutions ?
BTW, my falcon sits in a Lighthouse tower, together with two
harddisks and a CDrom. The Lighthouse tower is a big full metal
box so it should transport heat very good, shouldn't it ?

thanks
Gerhard

makes a difference.

Doctor Clu

From: fmh@netzero.net

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers. Buyer pays shipping.
I am also open to trade offers. E-mail me your list to ffmh@netzero.net or for
more info.

My want list is near the bottom of this list.

HARDWARE

Atari PC-1 Computer System. This is Atari's first attempt at the IBM clone
market. The IBM clone is in an Atari Mega ST case with a 5 1/4" 360K floppy
drive instead of the standard 3 1/2" ST drive. It has an 4.77/8.0 mhz CPU with
512K RAM. Has dip switched Video Adapter for MDA/CGA/EGA graphics. CPU comes
with an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled GEM Operating
system, and manuals that are photocopied. Serial Number is #0007 so besides
being very rare it's one of the First! Also included is an Atari PCM124 mono
MDA/CGA/EGA monitor in the box with paperwork. For both computer and monitor
$250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator

for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software for the Atari
computers. Works with ST 520 to Falcon. This is a special Michtron 9600
Send/Receive Fax Modem with software. The software is very efficient,
powerfull, and simple. Send, receive, view, log, and print, faxes. has
drivers for popular printers and the SLM804/SLM605. Use a spare 520 or 1040
floppy only as a stand alone fax machine. Comes with special fax modem,
diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't guarantee that
the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple computer and
video game consoles. All the games bellow are BRAND NEW and never used! Games
are $15.00 each shipped.

Battlezone*sealed*
Centipede*sealed*
Defender*sealed*
Dig Dug*sealed*
Galaxian*sealed*
Gremlins*sealed*
Jungle Hunt*sealed*
Moon Patrol*sealed*
Pacman*sealed*
Robotron 2084opened
Stargate*sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts. I no longer
have the disks or box but for someone who needs the docs here you go.
$1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game. Obviously with
the Road Runner and Wile E. Coyote. Comes complete with box, docs, and disk.
$5.00

Star Raiders by Atari. The classic Galactic Adventure game. Comes complete
with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game. Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room castle in this huge adventure game. Comes on 5 floppies. Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match the computer's pattern on the right side. Box states there are 400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST. Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1. Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find Merlin's Magic Wand in the 4 towers of the enchanted Disney Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack. Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings (Xevious clone) and The Secret of Steel RPG. Comes with disks, docs, and box.
$5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic Series title. For grades K-6. Comes with disk, docs, and box. $5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is the premier E-Mail package for the Atari platform. This is a German version that can be upgraded to V2.3f which is the latest for free via ASH's Web Site and can be in English via the free RSC files also from ASH's Web Site. For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that

is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon. Comes
complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system for your
Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing program for the
Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully integrated
BASIC compiler and editor to create compact and quick Atari programs. Comes
with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured word processor
for the ST to Falcon. Comes with 2.0 and 2.2 manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software. Does VT-100
with a built in word processor and more. Comes with disk manual, and box.
$5.00

Squish II by Trace Technologies. Save storage space quick and easy compress
your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing program. Comes
with disks, docs, and box $5.00

2847. 4Sale: CrazyDots II VME gfx card [USA]

Newsgroup: comp.sys.atari.st
Date: 2001-08-14 17:16:14 UTC
From: Lonny Pursell <fatal@SYNTAX.ERROR>
Message-ID: <Pine.MNT.4.10.10108141705150.88-100000@TT030>
Source record: 42574

As the subject suggests I have such a card to sell.

$200 for the card
$5 s&h anywhere in the USA

No manual or driver. Requires NVDI v4.x with the ET4K support
or NVDI v5.x.

This is a 1mb card, sample modes would be:
640x480 24bit
800x600 32k or 65k
1024x768 256 colors
The card is fully programmable with the NVDI package.
If your monitor can take it you can push the video right
up to the 1mb limit of the card. For example I ran
1152x896 in 256 colors with a custom mode.

I do not wish to ship this outside the USA, sorry.
Was used in my TT030.

Please direct all questions to my e-mail box below.
Thanks.

Lonny Pursell atari AT bright DOT net www.bright.net/~atari/

> microphones the noises of both fans are very disturbing.

Replace fan simple with an new one. Thatï¿½s silent. Use heat contact glue
to (a smal drop of !) fit the fan heat sink on top of cpu. Centek use
double side tape !! for a lot of heat sinks. Thatï¿½s not effective.

(Double side tape wonï¿½t transport cpu heat and itï¿½s mechanical unstable)
(Fan fall down while computer moved to an other place :/)

> Are there any better solutions where I could get rid of both fans
> ideally, and maybe get some big, temperature regulated fan ?
> Or are there even better solutions ?

Thatï¿½s posible. Regulated fan works fine here.

> BTW, my falcon sits in a Lighthouse tower, together with two
> harddisks and a CDrom. The Lighthouse tower is a big full metal

Anytime the best way. PSU fan is good to exhaust the hole case.

What about graphics created with the Neochrome program??? Do you remember
the Neochrome picture of a waterfall that looked like it had moving water???
This was done with "color cycling"... IIRC, I have some old Neochrome
graphics packed away somewhere...

Hi John,
I'm afraid I burned myself out with that project - no doubt letting a lot of people in the lurch at the time - I was so phobic I couldn't even turn the computer on for 18 months or so... <sigh>

I still have the info from that time, though. I had names from the following locations in the north of England:

Netherton, Merseyside
Heysham, Lancashire
Bradford, West Yorkshire
Wigan, Lancashire

I'm very conscious that people may not still be active since this list was last updated, so if any of these locations are good for you I'll supply the names on the basis that they may not be current.

There is a FREE IDE interface for the Apple II being planned on
comp.sys.apple2. It uses 7 74 series chips in the prototype. The prototype
works. People are now trying to improve it to automatically recognise tracks,
sectors, heads etc. So the rationale is sound for a niche computer.

The CT2 CPU-Fan is definitly needed. I have my CT2 in a large tower box as
well, and the CPU-Fan stopped spinning some weeks ago. The machine became
extremly unstable. I bought a new standard PC fan (cost less than $10),
put it in place and it works nice, I can't even hear it spinning with
open case.

The Falcon motherboard fan can't possibly do any good in the tower?
If it creates unwanted noise, I'd disable it.

Nope; its the only online Atari 68k clas machine running a real ST
BBS with real ST games.

>The JYBOLAC Stargate BBS is still up and running and going
>strong. Granted this is not a "classic" ST BBS, but a new
>one running on a real connected TT030 running Linux. Okay,

Running linux on a Atari machine is way cool, but its still not
classic; you can play nethack on any platform, but you can only play Space
Trader Elite on an ST BBS ;)

>Anyway, several games to be played, local discussion
>board and realtime chat with other users that are logged
>in at the same time.

Sure; all good; its just not an ST BBS. Its a good online telnet
bbs though.

>(We cannot keep the BBS scene alive without a little friendly

Competition ?Naah, none. Peopel should use both my bbs and this
one, and a bunch of the PC ones, too .. Trade Wars is still the greatest
online game almost. Second only to Space Empires ;)

What's new at TAT? Here ya go!

* NEW! Lynx Rampage Review by Matthias Jaap.
* NEW! Activision on the 5200 by Brian Rittmeyer.
* NEW! 7800 Asteroids review by Joey Kay.
* NEW! Oink! Review by Brian Rittmeyer.
* NEW! Updated 7800 and Jaguar games Listings.
* NEW! (as of 8-5-2001) Primal Rage moves list!
* NEW! Cool Site of the Week.
* NEW! TAT Poll. How often should the site be updated?

Here's a sample of Brian Rittmeyer's Activision on the 5200:

"So much had been achieved with the titles on the 2600, there simply was
no substantial leap to be made in the games on the 5200, aside from some
touching up. Perhaps the 5200 hardware was not the leap over the 2600
Atari made it out to be. Sure, there's the obvious technical
differences, but Activision showed what could be done on the 2600, while
others would need the 5200 to achieve nearly the same results."

Don't forget, writing articles for TAT can earn you cash! Visit
http://www.ataritimes.com/writer for more info.

Hi Ken,
The following information was posted from the Protext author on Jan 1st 2000, so there's a chance it's still valid. Quite shortly before this I'm pretty sure he was still selling Protext v6.5 or v6.6 (not quite as updated as the PC version).

==========
arnor/protext #2068 of 2070, from mtilley, 249 chars, Jan 1 10:46 0

Yes, you can buy Protext version 6.7 for £49.99.

Cheque please to

Brian Watson
Protext Software

> of (they cashed my cheque, nevertheless).

I dredged up some old info as I checked an anwer for Ken.

Arnor originally distributed Protext, but went into voluntary liquidation sometime in 1995 (no-one lost anything with this - I think the overheads just got too much). After that, distribution went variously to Compo and Comsoft in Glasgow, both of which went down owing the author money, as well as other distributors in other countries.

I think the author, Mark Tilley, took ownership back on the product and started selling it under the name of either Protext Software or Silverdock Ltd. At this point, the version number went up to v6.7 on PC/Amiga and ST versions to differentiate it from the distribution by others. I don't think this was actually any different to v6.62.

The last I heard there was talk of a v7 for the PC, but I've lost track. Check the web site quoted in my message to Ken.

> CAF and never have problems - and I belive them. Uwe???

I've tried out HD Driver with CAF and have found the same as you. I don't
know, maybe there's some setting we're missing, but I can only get CAF to
reliably work using ICD Pro or AHDI.

> Well, since HD Driver is the driver I use when I'm doing _anything_
> else on the Falcon, I've set up a floppy that I can boot from, that
> loads the ICD Pro drivers instead. When running CAF under ICD Pro, I
> don't get these crashes. But the random pops and clicks still appear.

Another idea... I normally use CBHD (which also seems to have problems with
CAF), so I don't know if this works with HD Driver, but try using HD Driver
as your normal driver, and use a program like Superboot, X-Boot, or whatever
boot manager you like to run ICD Tools. Just set up a selection for "Audio"
or whatever, and run ICD Tools from the AUTO folder, selected by the boot
manager. This seems to work great for me.

I've never personally had these noises, so I can't suggest anything
regarding the driver on this point, but I have heard that the brand or model
of drive you use can cause similar problems.

> * (3) *

I have Nemesis, and couldn't be happier (unless they made a modern CPU
upgrade that worked with CAF... nice dream, huh? :)). Very stable, and CAF
has no audio or stability problems to speak of.

This is a new twist! Great thing to check! I'll have to make sure I go iin
and dust off the fan from time to time!

2867. qb2c for MiNT

Newsgroup: comp.sys.atari.st
Date: 2001-08-15 06:37:37 UTC
From: jba4@po.cwru.edu
Message-ID: <3b7a16da.72348200@news.cwru.edu>
Source record: 42639

Hey everyone. I'm looking for a GNU program used to translate Microsoft QuickBASIC programs into C code, called qb2c. I have a lot of utilities I have created on my PC (just console programs, no graphics) that I would really like to use on my TT. I haven't had a chance to install my copy of GFA BASIC, but I really don't want anything that powerful yet. Has this program, qb2c, been ported? I saw on kellis's homepage that she performed a port, but it is not available on the page and I have not had luck with e-mail yet. Thanks for any help!

> partitions and what does TOS make of them if it tries to read
> them? (I occasionally have to run without MagiC).

TOS will not see them because they have a non-standard partition ID of
"F32" instead of "GEM" or "BGM". You can create FAT32 partitions with
HDDRUTIL (->HDDRIVER) or with a Tool for MiNT. FAT32 partitions are what
Windows9x uses for large partitions.

>qb2c can be ported without any effort at all.
>Just configure and make, then wait a few minutes.
>Bam, done.

I tried that, but I have a couple errors on some things. First of all, configure always gives problems. I can't get it to run all the way through. Now if I manually compile it, I get some variable errors, which I assume means that it does need to be configured properly. I'm just not having much luck and was hoping someone else had already done it. I guess I'm just lazy ;-). I'll try again!

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 3.00 Art & Film Director (Epyx) -- $5.15 shipping, due to
weight, counts as 1st item
$ 3.00 Death Sword (Epyx)
$ 3.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 3.00 Final Assault (Epyx)
$ 3.00 GFL Championship Football (Gamestar)
$ 3.00 Keith Van Eron's Pro Soccer (Microplay)
$ 3.00 Lands of Havoc (Antic Software)
$ 3.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 3.00 Quadralien (Spinnaker)
$ 3.00 Renegade (Taito)
$ 3.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)

$ 3.00 Warship (Strategic Simulations, Inc.)
$ 3.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 3.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 3.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 3.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 3.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 7.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.15 shipping, due to weight, counts as 1st item

$ 7.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 7.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 7.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 7.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 7.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 7.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.15
shipping, due to weight, counts as 1st item

$ 7.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.20 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

2873. Wanted (UK) STOS Maestro Plus

Newsgroup: comp.sys.atari.st
Date: 2001-08-15 12:47:35 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <9ldqu8$52a$1@pegasus.csx.cam.ac.uk>
Source record: 42589

The subject says it all, I'm looking for a copy of STOS Maestro Plus with a working sampler cartridge, preferably from a UK source.

FYI, I have tried the Trade in Post and they only stock the original STOS Maestro which is no good to me unless it will accecpt recordings made using SAM on the Falcon, which it probably wont.

thanks,
Stephen Moss.

Hi,
If you still have mic level input, I recommend you to check out the line level modifications on my website.
A circuit for damping the input signal wouldn't be a good idea, since it's amplified very much in the following stage (because the input stage is adapted for amplifying a weak microphone signal). You'll add much more noise than necessary that way. It's much better to modify the circuitry in the computer.

Best regards,
Claes

2879. The CGE Was Great...

Newsgroup: comp.sys.atari.st
Date: 2001-08-15 17:56:09 UTC
From: ebaiz@skyenet.net
Message-ID: <ZIye7.16$SN.8965@newsfeed.slurp.net>
Source record: 42595

Hello All...

Just got back from the CGE in Vegas. Had a great time and so did my kids. I was able to be there both days and I must say the show was a hit. It was so crowded I hardly was able to play any of the arcade games that were there. I stopped by the SongBird booth and talked to Carl. I bought 2 copies of the Lynx version of Raiden. My kids and I loved the com-link support feature and were able to play together as I brought two of my Lynxes with me. I then went to the Good Deal Games booth and talked with Mike. He remembered me as I wrote the 800XLDJ article that his site has posted. He was real nice and chatted with me a long while. I also went by the B&C booth and noticed a new space game for the Jag being demoed. It was great and had great effects. They only had about 4-5 carts for sale, so I bought one for $60. The name of the game was Space Wars. Nice game and just as much fun as Battlesphere, just not the spectacular graphics. My 11 year old son won one of the competetions, namely the Dragon Spirit competition. He was the yougest winner as most of the others were at least 20-30 years of age. I also attended the Dragon's Lair lecture with Don Bluth and company. I even was lucky to get an autographed posted with Don's signature. I am going to frame that and hang it some where. All in all I had an excellent time and took alot of pictures. It was nice to see all those Atari T-shirts. I was wearing an original Atari shirt with "Atari" written accross it. I just cannot wait until the next I will be able to go. Probably in about 2-3 years. It you did not go, you missed out.

Hopefully Uwe will have some advice on this one. Maybe it is some
small setting? Or it's just that all Falcons have their own little
quirks, and each one reacts differently in similar situations?

>Another idea... I normally use CBHD (which also seems to have problems with
>CAF), so I don't know if this works with HD Driver, but try using HD Driver
>as your normal driver, and use a program like Superboot, X-Boot, or whatever
>boot manager you like to run ICD Tools. Just set up a selection for "Audio"
>or whatever, and run ICD Tools from the AUTO folder, selected by the boot
>manager. This seems to work great for me.

I use X-Boot, but I recall not being able to use anything that was ICD
when HD Driver was the "installed" driver. You have to remove HD
Driver and then set up ICD again. And the reverse was also true.

So booting with the floppy that contains the ICD driver seemed to be
the only way I could get it to work (since ICD loaded from the floppy
and gained control of the hard drive before HD Driver got to it - in a
manner of speaking). But I might try your suggestion, as I started
doing this quite a while ago, and might be remembering it wrong!

>I've never personally had these noises, so I can't suggest anything
>regarding the driver on this point, but I have heard that the brand or model
>of drive you use can cause similar problems.

I had a friend with a C-LAB Falcon, who also used the same drive I do,
and he never had noise problems like me either.

>I have Nemesis, and couldn't be happier (unless they made a modern CPU
>upgrade that worked with CAF... nice dream, huh? :)). Very stable, and CAF
>has no audio or stability problems to speak of.

Yes, I was very pleased with the Nemesis. Plus, it seemed to help a
bit with the SCSI "timeout/lockup" problems I had in the past.

>This is a new twist! Great thing to check! I'll have to make sure I go iin
>and dust off the fan from time to time!

Me too.

>Always a good idea, this defragmenting thing! :)

Well I always start with an empty partition. And after the recording session, I back up the audio data and then do a defrag with Diamond Edge. But I never tried it as a way to eliminate the pops and clicks. Whenever they would show up I would just delete the track and record it again, hoping that another noise wouldn't show up. And of course, they almost _always_ show up just after the vocalist nails a perfect take! Anyway, I plan to do some testing this weekend.

>Would you mind if I put this on my web site?

Go ahead, put it up! And I think I have some more CAF "hints, tips, and tricks" stashed away in a folder on my Falcon. I'll dig through it and see what I can find. If you're interested, I can send you some of it as well.

2882. Emulator for Pagestream?

Newsgroup: comp.sys.atari.st
Date: 2001-08-15 20:46:55 UTC
From: claytone@foxinternet.com
Message-ID: <3b7adfbf_1@news.foxinternet.com>
Source record: 42599

Hi Atarians-

I'm interested using an Atari emulator on a laptop PC. The main program I want to run is Pagestream. Does anyone have a recommendation of what emulator will run that program? I (obviously) haven't looked into this much yet. Is there a web page that gives the pros and cons of different emulators? At this point, I don't think I'll need midi capability, but I may in the future.

If it matters, the laptop is a Compaq Presario 1200-XL106 with an AMD K6-2 at 475mhz.

Thanks very much for any info,

Clayton Murray
Seattle, WA USA

Hi Phantom

I may be mistaken (I suspect we'll find out shortly), but isn't
it possible to use an ST, or STe, or TT keyboard in place of the
Falcon's? This would make it a lot easier to get a replacement.

Not Floppyshop, Ken, which was just across the river from me in Aberdeen
The two places were one in Glasgow, the other somewhere in England.
Meanwhile, I'm searching my disks for your wanted Convert.prg.

Charles.

I would recommend GEMulator as being the best non-game emulator. I use
it with Pagestream 2 all the time.

Yes, very true, it is not classic. Having a Real ST BBS is Cool! Wasn't there a game called Robot War or something on the ST BBSes in which you selected different armor and weapons then built a robot. You then battled other people's robots, got money, and then bought better weapons. Does anyone know what game this is, and is it still around somewhere? I spent hours playing this online years ago.

Hi Clayton

I think you can now get a version of pagestream that will run directly on that machine, check out the webstied, www.softlogik.com. it should be listed there.

>
>#d ;
> ^^^ (from 45 to 78 spaces)

Hi Vassilis,
With Magic 6 it looks like all that is done with MAGICCFG.APP
(no need for an editor). There are 45 spaces on line #d. If I try to leave
the field blank for TS it sets itself for "0". The field for Priority
stays blank. I'm wondering if all of this has anything to do with my
system locking up and getting error 69 and 68000 Exception messages!
And which program is showing the message (Magic, NVDI, HDDriver). At
present I'm using the CPX: TS = 25 and Priority = 1:32 and not setting
anything in Magiccfg.app as you've suggested. Can both be set for the same
values or that still a no-no?

It's possible, the original keyboard can be swapped with a STe or STFM
keyboard. Mega ST, Mega STE and TT keyboards also work fine, I've used
all of these with my Falcon. Just take a look at the pinout, and wire
RX<->TX, TX<->RX, GND<->GND and +5V<->+5V.

Why can't you use that char? The fonts delivered with Calamus holds this
char. It's also explained in the manual of Calamus 1.09N. See IX p.9/10

The overview of the current character set is available from one of the command fields dealing with fonts, if the "@" character is not listed therein then you will not be able to type it (or insert it at the cursor from that window). In that case you should choose another font or load the font into a Calamus font editor and make one yourself.

>I have "standard Falcon" - mini plug input.

Hi Ken,

I believe even the modified ones had 3.5mm miniplugs, with a bypass to
all or part of the amplifier stage. That is the best solution and
there is instructions for this on Claes's website:
http://www.holmerup.com
It should not be too difficult for anyone with soldering experience to
undertake, but be careful not to overheat the board!

>attenuator pad - you said 60db or 1000:1 maybe less.
>Would a 40db attenuator work?
>My mixer is a sound reinforcement/stereo mixer.
>Very strong preamp stage.

All you can do is try it and see. It won't do any damage to the
curcuits with a 40 dB pad, but if you get clipping or overload in
your recordings at peak sound levels then you need more.

I suggested 60 dB because mike level is typically -60dBm and line
level around 0dBm, though it can be more and often is less. Is
your mixer not marked with output level?

Regards, /Peter/

A few years ago in this very group was a chap that was the sysop of the official support BBS for Chet's programs. I think his name was Tom Forrest (?). Anyway, he told me in email correspondence that Chet had moved onto programming for Windows.

I registered MVG with Chet way back in time and it's still a great program for retouching b/w scans etc.

Sorry I can't help further, but perhaps someone can remember more?

Best wishes
Mike Kerslake

Hi Ric!

Most of the fonts with Calamus 1.09 (Swiss, Time) do not include
it, but ARC_75.CFN does. Some PD CFN fonts have it too - others
not.

Quick way to check is with Look'n See. This draws all character
outlines of a font on the screen (outlines, not filled, but easy
to see styles and which characters are included). I've installed
L'NS as my desktop viewer for almost all files, so I just need to
click on a CFN file and it loads and displays. Does the same for
*.FNT bitmaps too.

Regards, /Peter/

Hmm... Well, I haven't run into any problems doing this. It acts like the
ICD driver running from the AUTO folder overrides the "installed" driver.
Maybe another wierd quirk to my particular setup, or maybe there's some
underlying problems that I can't see yet. But it works for me so far.

Thanks to everyone for your help.

I have looked closer and it appears the two fonts I use almost exclusively,
Time and Swiss don't have "@" in their character set. I have found other
fonts eg Glip and Lucifer which do produce "@".

Where do you get hold of a Calamus Font editor from so I can try to create
"@" for Time and Swiss?

Hi James-

I looked all around for SoftLogik, but they're nowhere to be found. They have been taken over by (or become) Grasshopper LLC.

http://www.grasshopperllc.com

They no longer deal with Atari, but you CAN get Pagestream for Amiga, Mac, and PC. The cheapest upgrade to a PC version from my Atari 2.2 SE is $100. I'll keep persuing the idea of getting an emulator up and running. I've been looking at STEem lately. It's supposed to do midi too. There are quite a few emus available. I'll probably want to get other Atari programs onto the PC eventually. I still have my Falcon, and I use that for all midi and most email, amongst other stuff. I got the PC mainly to do browsing, but am finding it useful for a few other things too. I wish there was a NEWSIE for PCs. I really hate Outlook Express! Oh well, can't have everything.

Thanks everyone for all suggestions. I'll post a few web pages of interest when I've poked around a bit more.

The CG Times font family which came with my 1.09 version does include '@'
The same for the CG Triumvirate font family (a swiss alike)

>
>Where do you get hold of a Calamus Font editor from so I can try to create

The only two Calamus font editor I'm aware of are commercial.
TypeArt from Invers Media: 101,75 EUR. This is really a very powerfull
font editor.

Fonty from Matthew Carey (UK) A low budget font editor. You can get it
from FaST Club, UK. Not sure though if FaST Club still exist today.
More info at: http://www.cix.co.uk/~peckham/Fonty.html
It seems Europe Shareware distribute Fonty too, see:
http://www.chez.com/europeshareware/atari/fastclub.html

2908. Dungeon Master Java

Newsgroup: comp.sys.atari.st
Date: 2001-08-17 15:54:18 UTC
From: bigcalm@hotmail.com
Message-ID: <71cc6cb6.0108170754.5aebdb3f@posting.google.com>
Source record: 42627

For all those Dungeon Master fans, there is now a clone of it, written entirely in Java so you can play it on any platform that supports it. The official website is:

http://www.cs.pitt.edu/~alandale/dmjava

You'll also need the Java runtime engine v1.3 for your particular platform, available at:

http://java.sun.com/j2se/1.3/jre/

The author has created a completely new dungeon, added a level editor (so expect the original DM map to be recreated by someone), several new spells, and increased the difficulty level (some people would say too much).

Enjoy
- BigCalm

Message-ID: <tmbf7.7348$SQ.303104@e3500-atl1.usenetserver.com>
Source record: 42630

I'm looking for a good DTP package to use on a Falcon.
I have PageStream that I've used for years but now I'm looking for a DTP program that will allow 256 Colors or even TC on screen and supports some of the latest InkJet and Laser Printers. Good Color and GreyScale print outs is a must. Also sometype of Scanner support would be nice.

It will be used mostly for News Letters.

I also have a older version of Calamus, but haven't gotten into it.

Are there any DTP packages that are still being supported and updated?

Any lists of DTP packages with the latest version would be appreciated.

This is incorrect. Look under the ordering info on the grashopper site (they took over pagestream several months ago btw) you can still order V2.2SE for the ST for $20US or $10 for an upgrade from pervious version. This is much the same policy Softlogik had for years when they still had pagestream. I remember in the early 90's there was an uproar among pagestream users when softlogik upgraded the Amiga version to 3.0 but not the atari version (this was long before any pc / mac versions)

There is a new "lite" version of calamus SL but my experiences as I remember calamus was strictly a monchrome only although it was supposed to support colour output to printers. The major problem I had (and it was major) was that the program used to generate printer drivers was an early beta (ie. should have still been an alpha) version that was very buggy. it didn't support many printers past 1995 (none of which are still available anywhere where I live) and it tended to generate buggy drivers that had trouble handling the correct page length. I abandoned calamus because of this and bought the much cheaper and easier to use pagestream.

>
> Are there any DTP packages that are still being supported and updated?
>

While not marketed strictly as DTP, Papyrus in its current job may fit the bill. Some local users have it and it works quite well. It can do reasonably good page layout, multiple fonts, imported images. It can even produce html files as output.

Hi,

I have two 1040STs with built-in floppies. One is flaky, doesn't run very well but has TOS 1.4, the other one works fine but has TOS 1.0. Assuming both TOSes are on 6 chips, can I just swap the chipsets to upgrade the good ST?

Hopefully, the first machine's problems aren't being caused by bad ROM chips. :-)

Thanks,

Phil

If you have ever seen copies of Atari Computing magazine then you'll
see what is possible with Papyrus/NVDI. I did all the magazine using
Papyrus v4 (apart from some advert pages) and it is well up to the
job. Colour output is quite possible as well.

Best wishes

>
> What exactly is the GDPS and where can I find more info on it and the
> software?

AFAIK, GDPS is just a standard for writing software that allows any program to talk to any piece of hardware. It functions the same way TWAIN software functions in the Windoze world. You write the ability to use a GDPS device into your application software, and the ability to be accessed as a GDPS device into the software peripheral. So, in the case of your scanner question, any piece of software that is written to be GDPS compliant can use any scanner that has software that is GDPS compliant.

I have a copy of the scanner software for HP scanners. It is GDPS compliant. It is installed as an ACC, so it shows up in the accessory menu and works fine from there. However, if you are in Photoline, for example, and you click on GDPS scanner the same software is displayed. When you scan your photo, the scanned image opens into a new window in Photoline.

There used to be a public domain GDPS scanner driver for Epson scanners. I don't know what happened to it. I tried it years ago and personally found it to be buggy. It could be quite different now.

As near as I can tell, GDPS stuff never made much impact here in the US. For that matter, neither did the Atari. :-(But it's my impression that GDPS support was quite popular in Europe.

As James Alexander stated, Papyrus will more than do what you wish, and
is still supported. Calamus is the only DTP package still being
developed for the Atari.

DA's Layout is, IMO, another good DTP program for the Atari. I have it
and Calamus SL98. Calamus is strictly "frame" based, where Layout is
more like Pagestream when it comes to inputting text.

> I also have a older version of Calamus, but haven't gotten into it.

How old? Version 1.09n was monochrome only. The next major upgrade was
Calamus S/SL. S, I believe, was mono only, with SL being color. I
don't know anything about the "lite" version of Calamus.

> Are there any DTP packages that are still being supported and updated?

Only Calamus. And it runs on Atari, Mac via MagicMac, and Windows via a
built-in emulator.
>
> Any lists of DTP packages with the latest version would be appreciated.

Layout's last version was 6.1, and it's now Calamus SL2000. Calamus has
an English language forum for questions at
http://www.calamus.net/us/forum/

Hi Ken and Phantomm,

IMHO, there is sadly no DTP package for the Atari platform that is capable of producing good color output from any modern printer. When I used B/W, DA's Layout was good enough, but the acquisition of an Epson 850c, arguably the best, supported color printer for the Atari, showed that ALL the top DTP packages are incapable with or without the aid of error diffusion like aids or NVDI of producing anything but crude colour prints, not in the same league as the 'photo' like printouts from the PC and Mac machines. The Atari platform was long ago abondoned by all the major print driver producers. I have been forced to change platform to the Mac to get even semi-commercial quality colour printing, and that change was from a Milan. Sad fact but true.

Did you check the DHS site out?

This site has an excellent collection of graphics programs, music players and trackers, programming utilities AND demos (main reason for the site).

It's worth checking out even if you aren't into demos (good news page too). It's recently had a redesign and looks great even if you turn graphics off in your browser (like I do). Not many sites can claim this! :)

Have you checked in the Calamus forum as to what's currently available in the way of printer drivers? There is a VDI driver for the Atari version that accesses any printer driver available in NVDI. That leaves the responsibility for the new printer drivers up to NVDI. NVDI 4 would let you create your own printer driver, but this feature went away in NVDI 5. I heard it was some sort of flap with printer mfgrs. not wanting their printer codes out in public or something. Tis sad you now have to pay an arm and a leg for information that used to be provided for free, i.e. the printer's programming codes.

AFAIK, drivers for Atari software have always been written by Atari software programmers, not the printer mfgrs., probably due to lack of sales of this platform.

In the Windows version, you use the Windows printer drivers, so no dedicated Atari drivers are needed. I suspect the same is true under MagicMac.

The printer driver question for the native Atari version would be a good question for the Calamus forum.

2932. FastCopy Pro

That should work as long as you put the chips in the correct order. If
you have TOS 1.0 on disk, run it on the bad ST and see what happens.

Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

Yes I have investigated Calamus 2000, the demo is available, and that's
what I used, just in case Ulf is reading this and still wondering why
I'm not on his little data-base of buyers!!. and no, from examples I
have seen of color prints using the NVDI5 drivers and the Starscreen dot
diffusion drivers, it is not up to the PC/Mac equivelents, in just this
aspect, I must emphasise. It may be that the software is not good
enough, though to my simple mind, the set of codes for the various

attributes of a printer, surely can't be that arcane, or it could be that the processing speed of the Atari platform, is just not high enough to do the maths of dot placement in the time available. We have had, in substance, an admission in this NG that even the top DTP available to the Atari platform is incapable of the quality of color printing obtainable by PC/Mac, using the system and or printer manufacturer's drivers and even advice to change platforms, if we want such quality from said top DTP.

I don't know what you do for profession but I have a friend who is a
professional printer. His main system is a Mac G3 with MagicMac nowadays
but he still have two TT's on which he do lots of DTP work with
Calamus. He prefers Calamus above QuarkXpress and Adobe Indesign.
The incapability to print out high quality color prints has IMHO nothing
to do with Calamus. It's just a matter of lacking a good printer driver.
Switching over to NVDI to print was not a good decision at all but it
was the only economical solution. Writing special Atari driver printers
is for a commercial softwarehouse a non-profitable business.
If one have a Mac or pc one can make high quality print of Calamus docs.
Just convert the docs to tiff or PDF and there you go.
Furthermore I think on Mac and pc one can make use of the system
printer to print out Calamus doc directly from Calamus.

It sounds like you haven't had the machines open yet, is that right?

If so, it may be possible that the "flaky" machine is simply suffering
from "chip creep", a malady that seemed to befall most STs at one time
or another.

The problem is that having the keyboard mounted directly over the
computer's motherboard will, over time, subject the motherboard to
flexing and twisting, as you pound on the keyboard.

(This doesn't affect the models with separate keyboards, like Megas
and of course PC compatibles.)

What happens is that over time the chips on the motherboard which are
not soldered down will start to "creep" up out of their sockets.

Eventually the contact between the legs of the chips and the contact
points in the socket become intermittent which can cause ALL kinds of
problems, including problems with the floppy drives.

If this is the cause of the problems in your ST, it may be possible
for you to fix it very easily.

All you have to do is to open the plastic case by removing the screws
in the bottom, then remove keyboard by gently unplugging its cable
from the motherboard.

The most difficult part of this "fix" usually is removing the metal RF
shield under the keyboard. Some of the early STs had little tabs
which could be easily untwisted with a needle nosed pliers, but later
ones were soldered to keep users hands out of the machines.

If yours is soldered, you can use a sharp wire cutter to cut the tabs off, or best solution of all is to unsolder the tabs.

Once you have the metal cover off the motherboard, locate all the large chips which are inserted in sockets.

Gently, but firmly, press all the chips down into their sockets with your thumbs.

You should hear a definite "crunch" sound as the chips reseat.

The big M68000 CPU chip is usually soldered in place, but the TOS ROMS should be reseated (these can cause REAL problems if they've started to creep), the MMU chip (in a four-sided socket), and anything else in a socket should all be pressed back down. There's a video shifter chip usually under a metal cover in a small metal RF shield that's usually socketed too.

Reassemble the RF shield, plug in the keyboard and put the case back together, then flame on and see if reseating the chips has fixed anything.

My original 520ST had so many problems with the chips (er, especially after I'd added memory upgrades) that I just left the case loose so I could reseat the chips any time things got a little flaky.

It's worth a shot, and won't cost anything to try.

Hi Martin,

A friend who has had access to Calamus on all three platforms confirms everything you say. It seems that Atarians are being kept in the dark (possibly through well meaning partisanship in this group) as to the capabilities of Calamus and other packages needing external printer drivers, by the poor standard of drivers available. He was 'shocked' by the high quality of the PC/MAC printout, compared with the Atari. All this still begs the question why such poor drivers, you say commercial necessity, and of course you are correct. I already know (from said friend) of the various 'get arounds', but all these conversions and switching from one platform to another are like a man who goes to sea in a leaky boat and has to put on a high quality life jacket when the boat sinks: how much better to have used a sound boat in the first place.

I am not a professional printer, just some one who likes to do things, including the odd poster, flyer and newsletter properly, ie not be ashamed to show the results to my PC owning friends.

I have a Milan and a Falcon and so could certainly try your friend's method.

Thanks for your helpfull comments,

Bob King

One also has to remember that as the dpi of a printer increases, the
value of starscreening diminishes.

Newsgroup: comp.sys.atari.st
Date: 2001-08-19 09:46:13 UTC
From: Klaus Bahner <Klaus.Bahner@mail.tele.dk>
Message-ID: <3B7F8AE5.A9CA660B@mail.tele.dk>
Source record: 42522

Hi folks,

Finally I decided to stop my Atari activities. Hence I'm selling my
Atari:

Hardware:

* Atari Mega 2 ST (upgraded to 4 MByte RAM directly after system was
bought, I'm still the first owner). Runs TOS 1.04
* Original Atari math coprocessor board (MC68881)
* 105 Mbyte Harddisk in Mega ST case
* ATARI SM124 black and white monitor
* original keyboard and mouse.

Software:
* PureC 2.0: C development system
* Pure Profiler to the above compiler
* RIEMANN symbolic math program (and LISP like programming environment)
* PCB Edit V2.0 (printed circuit layout program)
* TurboAsm (registered shareware version)
* Hushi Harddisk drivers
* CTEX - TeX typeset system (freeware, but installed and working)

Books:
* ATARI Profibuch
* Motorola 68000 and 68881 User manuals
* Atari Mega ST schematics and monitor schematics

All the above software comes with the original manuals and is legally
obtained software. Manuals are in German, though.
The whole system is in very good shape. The only thing you probably need
to replace in the long run is the keyboard, the three following keys
"," "." "-" are worn out - meaning you have to press them hard to
establish electrical contact.

System is sold only complete for 100,- EUR plus costs for shipment.

If you are interested please email me.

All the best,
Klaus Bahner

>to do with Calamus. It's just a matter of lacking a good printer driver.

Given that Calamus uses "SoftRipping" to produce printed output, one would
assume that the only job for the printer driver would be to put said
"ripped" page onto the paper - all the diffusion, dithering and whatever
all applied to the image beforehand.

>Switching over to NVDI to print was not a good decision at all but it

Yep, IMG Squeeze is a great program, as is MVG. There is also the
program Chet did that turns ASCII files into nicely 'fonted' (!)
printouts - forget the name ATM. It was this program that got me in
touch with Chet. There were a few other UK users of the program at the
time.

I must dig out the gumf on this later.

Best wishes
Mike Kerslake

This indicates transmission errors, probably due to wrong termination or
cables being too long. Or this is a drive that is not compatible with
SCSI (less likely).

> Having tried to get Spin! working I have to say that I'm already pretty
> confused -not exactly easy and user-friendly...

Note that for using SPIN! you also need a SCSI driver for your machine,
either the old one included in the CBHD package or the newer version
that is part of current versions of HDDRIVER. But before the CD-ROM
drive is not correctly recognised there is no use in trying to get SPIN!
running.

Thanks for the tips, but yes, I have opened both machines and reseated everything. I think the problem lies within the memory upgrade in the flaky machine. Its been expanded to 4megs (it was already expanded when I bought it off ebay) and I always have to reseat the ram board and lots of times that doesn't fix it. I also frequently get orange dots randomly appearing on the screen which is a warning of impending doom. Kind of nice because it does give me just enough time to save stuff before it bombs. :-)

Most games refuse to work with it as well. May just be incompatibilities with TOS 1.4. I use a 520ST for games.

Thanks!

Phil

Hey ? What the hell with it ? I'm using Calamus SL 2000 on my Falcon,
and it does use almost every printer.
I created a 80x120 cm (yes! this is no typo : really 80x120 cm!)
pannel, using an Epson Stylus Color printer in 720x720 dpi CMYK.
Of course, it took a long time to print out all pages... but it's
very, very realistic! (I only had some problems with margins).
>>

It depends on what you really want to do with it, and the amount of
money you intend to spend.
For only typing letters, Papyrus seems to be O.K., but if your needs
are like mine, Calamus SL 2000 is a must, though for a full version

(i.e. with all important modules in their full version too) you will
have to spend about Eur 2000!
I first bought Calamus 1.09N (Eur ~450) then upgraded it to SL for
approximatively Eur 150, then finally upgraded it to SL 2000 for
something like Eur 250 ; I bought a couple of modules as well, for
a total of Eur ~200. With this, I can create almost everything I
need, and print it out on almost every printer.
But, if I only need to type a letter, I use ï¿½le Rï¿½dacteur 4ï¿½, which
I bought a few years ago.

>(mis)behaviour...

Isn't this a problem only for those programs that use their own
fileselector, or if you use Atari's early one? With MagiC, or
Selectric, you have buttopns for any drive A - Z. Even with
Atari's, you can type in the drive letter with colon and backslash
on the path name field and it will bring up the correct directory.
Does this not work with Tempus? Agreed it's a lot slower...

True. But isn't the problem with photorealistic printing on an
Atari is that PC and Mac programs usually use microweave to hide
the dot-pattern, and there is no such driver for the Atari? Must
admit I'm not sure how it works :-)

For really first class results, CVG files can of course be passed to
third parties for printout - even on an imagesetter - providing you
can find a suitable bureaux. There are still some in Germany.

Hi Klaus,

I gotta couple ST's already including a mega. but smeg this is a nice system. If it was a north american system I'd buy it myself. This is just the sort of setup I'd use in my work (electronics), especially that software.

The adaptec entry is a scsi controller if I remember correctly. As uwe said make sure the termination and cabling is good but thats no guarantee to make your setup work. When I set up my cdrom on my STe I had used Extendos pro which installed the proper drivers the first time for me. I recently had a bit of a headache on my TT so I can understand its not always easy, nor do the standard canned answers allways solv the problem. Anyways on my STe I had the hd I boot from as id 0 and the cdrom is 1 or 3 I think. Try setting up the cd as the last device (terminated) and the hd first (not terminated) and have the hd as id0 and cd as say scsi id 1. For some oddball reason (which still hasn't been explained) changing things around like that did work on my TT recently

Papyrus does for more than simply type letters, take a more serious look at it. Btw it also supports html output. Has this been added to Calamus yet? I know when MGI had calamus they couldn't be bothered. Not to mention fixing some of the modules that had bugs such as pks writes regular crashes.

> have to spend about Eur 2000!

Considering the current pricing very few atari users will be buying new copies, most will be like yours upgrades. That is considering the high price for the performance of calamus (which is FAR from perfect) and the rapidly shrinking ST market.

Hi Bob,

Whilst I havent totally abandoned dtp on atari systems I have noticed the same problem with printer drivers. Thats my biggest beef with calamus, not just lack of support for colour printers but lack of support for ANY new printer in the past 5 years. Even many of the older drivers just don't produce acceptable output. I have had some better luck with pagestream.

One of my other beefs is proper font sets. I'm tired of incomplete fonts and fonts with character spacing set to zero (ie all characters appearing on top of each other).

Wow that does seem like a complex setup. Extendos may cost more but it was easier to install. when I got my first cd-rom setup in my STe it was up & running in 2 hours, would've been 1 hour if I'd waited till moring instead of fiddling around with it at 3am.

Sadly, I have to agree. I hear people touting the greatness of 720x720dpi
from time to time here, but on my Mac, the fairly cheap printer I bought for
it (around $100) does 1280x720dpi. I printed a photo that I had scanned (on
a 1200dpi scanner) on photo paper and literally couldn't tell the difference
at all. I connected my Falcon to the same printer (it has both USB and
Parallel and can have both machines connected at the same time, very cool)
and could only get up to 720x720 and it looked horrible in comparison. When
we get up-to-date printer drivers (which is probably not possible anymore
due to the locked-up-tight mentality of printer manufacturers), then we'll
have something cool in programs like Calamus and Papyrus.

Perhaps that statement was worded poorly. The situation referred to is often called "M$ tax." Will M$ let you install a second OS along with theirs?

Be found out the hardway about all this when they tried to license their OS to other hardware venders. (Dell and IBM probably smell blood with M$ recent problems with the DOJ).

Yes and no. Current Adaptec controllers are usually SCSI controllers.
But the controller by Adaptec used with the Megafile/SH drives was an
MFM or RLL controller, resp.

> for the CD-ROM drive to work?

This depends on the CD-ROM driver. SPIN! requires (at least I think it
is required but not optional for SPIN!, the SPIN! README should give
more details) the SCSI driver.

> Apparently, since I'm using your HDdriver I already have this included.

In HDDRIVER this is included since version 7. If I remember correctly
you are using an older version.

> For those who *don't* use HDdriver etc. is this what "SCSIDRV.PRG" is
> for?

Yes, exactly. But see above, I'm not absolutely sure right now whether
SPIN! really requires this. I have not cared for this for a long time
since I do not use any SCSI software that is not based on the SCSI
driver anyway.

> I also understand that the "MetaDOS" software can be replaced with
> "BetaDOS" as this is a better version of the original Atari software?

I think the SPIN! README warns not to use BetaDOS because it has
numerous bugs.

> One question: Why is it that so much of our platform's software has
> these immensely complicated setup files?

You should ask the authors ;-).

> Absolutely not the way to install software in 2001 in my opinion.

I think one of the reasons that it is sometimes complicated is that
software like SPIN! evolved out of a design study and was not meant to
be a complete software package. Unfortunately Julian Reschke, who is the
author of SPIN!, has quit the Atari scene some time ago.
Note that the CDTOOL software, which was sold until some years ago by
Hard & Soft Herberg, used configuration files like SPIN! and was easier
to set up. So those who have both can most likely use CDTOOL to create
the setup for SPIN!.

Hi All,

Not sure which program is giving these messages or is misconfigured
but somethings up here. Running Magic 6, NVDI 5, HDDRIVER 7 on a 14 meg
Falcon MKI.

I get them when trying to get info on a drive's byte count (click on
drive icon and then "Information" in the Magic drop down menu). While the
drive is being scanned it is interrupted by "Path Overflow Error -70"
and "Invalid Handle" numerous times. Once the process is complete, the
second try at the same thing might not show the messages or less of them
and I'll get the drives info.
Any thoughts?
John G.

Somebody who has sufficient experience to edit text files for setup is
not necessarily a hacker. He has just more experience than the average
user.

> That's a real pity, because the idea looks promising. Perhaps someone
> still active could take over his work, iron out the bugs (if any) and
> make a proper GEM install/setup interface.

I don't think this will happen. Most programs that are no longer
developed anymore by the original author stay unchanged. This is because
there are hardly any developers for the Atari left anyway. And software
like SPIN! requires a really good knowledge of several subjects (low
level APIs, SCSI etc.), which most people simply do not have.

> But it's probably all in German, which might even make the "text-editor
> installation method" better in any case.

Yes, it's in German. There might be an English translation but I don't
know. Most likely you are better off with ExtenDOS.

HI Jim,

If you look at the (german(description of the Calamus 'Star Screening'
module, you will see that it uses FM modulation, whether this is
stochastic or true error diffusion FM, is not explained. Either way it
requires a lot of very quick processing at the driver level to
distribute the dot errors and that's the reason for my guess that the
Atari's clock is just not fast enough for a driver to have been a
realistic proposition.

Bob King.

Hallo Hallvard!

HT>One question: Why is it that so much of our platform's software has
HT>these immensely complicated setup files?

Well, that's just the freeware solutions having this problem. Both ExtenDOS and CD-Tools provide an easy-to-use setup program which will do all the copying and configuring for you.

2984. If you could design a $300 homecomputer today, what would you choose?

Newsgroup: comp.sys.atari.st
Date: 2001-08-20 20:55:46 UTC
From: ajpalacios@netscape.net
Message-ID: <6f45253f.0108201255.7fed298d@posting.google.com>
Source record: 42454
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.amstrad.8bit,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.advocacy,
comp.sys.atari.st,comp.sys.cbm,comp.sys.sinclair

I really wouldn't design a $300 home computer. Way too many models of home and "productivity" (read Palm) computers out ther. Let's focus on the hobby computer. Why is the hobbist so underestimated and underpriced today?

The Ideal Hobbist computer would be an Atari-like portable computer. CPU? maybe Z80 or 6502 derivative. A low power RISC or CISC Chip, but powerful enough to avoid the flickers and glimpses in audio and video. And it must have a modest enough memory space for you to write neat apps that don't need 3 CD's to install, but cartridges or Smart Cards.

Since no HD or CD is desired, SmartCard or PCMCIA or FlashCards are desirable as storage media. Also, the back panel must have serial, parallel, and "user" ports. User port should be an Atari, CBM or Apple flavor. So every pin of the CPU and every usable signal in the system is available.

Language? If BASIC is not allowed as the main language, then it should be the rapid prototyping language option, accesible thru software commands or a small switch. But BASIC MUST be included. The main language could be Pascal, but remember that rapid prototyping means no time for detecting every single variable to declare.

Video? Well, since our system is intended to be a field-usable system, an LCD is mandatory. I don't think an SVGA resolution is needed. But a VGA is desirable, and a quarter-VGA is good enough. We want to test system parameters, sensor response, GPS tracking, missile trajectory plotting, or just fish bank detection to be instant represented with our supercharged Game Boy, right?
But remember, we are planning a Hobby Computer, so most of the graphics could be displayed in a TV. Composite Video and VGA outputs are the only two choices.

Audio? Well, it must be CD-quality. No more, no less. Remember we cannot hear beyond 20kHz, so why should I buy a computer able to emit a supersonic or subsonic sound I can't detect? Well... Maybe for Dog training or Subwoofer testing! But anyway, CD is just what we need. And complete control over the waveform thru software.

Internet? Yes! A 10/100 base T interface so I can connect my hobby computer to the local net and download any data I gathered in the field. Just like an internet "appliance". But this could be added with a PCMCIA card.

Maybe what we're trying to figure out is a new, VGA, networkable version of the Radio Shack Portable Computer sold in the early eighties, with an open, well-documented architecture. I can see it: in one hand my hobby computer with a bunch of cables attached and a piece of custom hardware sending codes to the machine. Or maybe, a credit card interface attached to an electronic cashier just like in Terminator 2. Ooops, there are some disadvantages, but just don't see 'em.

I think I'll start designing it, since a computer like that is for us, the inhabitants of the dark, underground world of electronic hobbists. A customizable, in-house expandable, easy programmable box that can be instantly attached to any project just to test or diagnose or in-system emulate. But then again, it sounds like my old Atari!

You have to be careful here, as I found out. Windows printer drivers
have error diffusion of graphics, so you could be sitting there waiting
for the driver's error diffusion routines to run on a star screened
frame, which has already been "error diffused"!! <G>

>> we get up-to-date printer drivers (which is probably not possible anymore
>
> Why do you say something negative here? When I did so some time ago you
> started bashing me, now you do the same. Very interesting ...

Yes, it is very interesting, as I never meant at any time to bash anyone. I was only saying that I agreed with the person I quoted, that printer support is very lacking now on the Atari, compared to what I see on Mac and PC. It's not meant as a bash to anyone, just a commentary on the current situation. Please show me that I'm wrong in my opinion, as I would love to be able to print nice, photo-quality images using my Falcon! Also, I'm sorry if I came across in the past as "bashing" as well. That was never my intention. I apologize if it was taken that way by anyone.

However, I do maintain that this is a forum for discussion of Atari related issues, both positive and negative. I don't advocate saying that Atari's suck, because I have always loved Atari's, and still do. I simply think there are obvious areas that are lacking, software- and hardware-wise. And obviously there will be people that agree and disagree on these issues. That's very healthy, as long as it doesn't turn slanderous. Disagreements promote good discussion and potential action toward bettering the situation. Without that, we would just spin our wheels, all agreeing that Atari's are the greatest things on God's green earth and being blinded to advancing technologies. So some of what I say can be interpreted as "negative", and others positive. But I never intend to bash anyone for their views.

Hello all,

I'm new to this group, and wonder if anyone can help...
My Syquest 270 meg drive recently gave up the ghost (cart won't engage)
- I used it with a 4 meg STf with the ICD Link host adaptor. I have just
come across another Syquest drive, model no. MTS-270-MAC3, same cart
size, same connector sockets and the bare drive inside says "SQ3270S"
like my old one. I suppose I could swap out this drive and put it in
the old case, but does anyone know if it will work as is? The Syquest
web site doesn't even list this model number.

Thanks in advance for any replies,

Cort Sauerwein

Hi there

Well S-video is similar to composite but with a couple of differences, Luma and Chroma have separate pins in the connector for better picture quality. and of course the connector is different. I know most st's with rf modulators have composite out lines but cant' remember if separate chroma/luma lines are available, thats what you'd need to use.

> Any other good boot-selectors out there?

If you do not have more boot setups than partitions on your hard disk drive you may not need a boot selector at all. With some hard disk drivers you can boot from any partition by just pressing a key. This way you can have several boot environments with different AUTO folders without using additional software.
As long as the numbers of available partitions is sufficient this is the most convenient way of selecting a boot environment I can imagine.

Definitely not, at least not as far as HDDRIVER is concerned. With
HDDRIVER/HDDRUTIL it is displayed because HDDRIVER tries to recognize
the SH/Megafile series. If HDDRIVER thinks it is one of these device
"Adaptec ..." is displayed because this is hard-coded.

Yup, the orange dots on the screen indicate it's a memory problem.

Unfortunately the memory upgrades for the various ST models were all such kludges that problems like this are an accepted part of living with an upgraded ST.

The first one I installed came with waxed string to be used to TIE the upgrade connectors down on top of data buffer chips on the motherboard (and pray it would keep them connected), Chewing gum probably would have been more effective. In fact, many upgrades actually included strips of "double sided foam sticky tape" to hold things together.

A few of the early ones actually came with tiny "alligator clips" to connect the memory board to the chips on the motherboard. Sneeze anywhere in the room and they'd all pop off.

I didn't get an upgrade that was anywhere near stable until I got one that had a small "daughterboard" that soldered onto the bottom of the MMU chip socket, on the reverse side of the motherboard.

After that my system was mostly stable... mostly.

Sounds like you're on the right track after all. Swapping the TOS chips into the other machine may be the best answer, unless you can

figure out a fix for that 4Meg upgrade.

Your 1040STF does NOT have composite video available as an output.

IF it was a 1040STFM <-- note M, it would have a video RF modulator
built in.

In that case you could simply connect the RF modulator directly to the
TV tuner card and tune the card to Channel 3. It wouldn't be the best
video, but it would work.

STs which have RF modulators also have composite video available on
one of the pins in the normal Atari monitor port. You MIGHT be able
to somehow adapt that to the S-Video input on the tuner card as James
mentioned.

In any case all that is moot, as your 1040STF has NO video output
other than the RGB signals from the monitor port.

You'll have to come up with some kind of RGB to S-Video adapter in
order to connect the two computers together, unless your Tuner card
can handle the RGB signals directly.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 08/15/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 3.00 Art & Film Director (Epyx) -- $5.15 shipping, due to
weight, counts as 1st item
$ 3.00 Death Sword (Epyx)
$ 3.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 3.00 Final Assault (Epyx)
$ 3.00 GFL Championship Football (Gamestar)
$ 3.00 Keith Van Eron's Pro Soccer (Microplay)
$ 3.00 Lands of Havoc (Antic Software)
$ 3.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 3.00 Quadralien (Spinnaker)
$ 3.00 Renegade (Taito)
$ 3.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)

$ 3.00 Warship (Strategic Simulations, Inc.)
$ 3.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 3.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 3.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 3.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 3.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 7.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.15 shipping, due to weight, counts as 1st item

$ 7.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 7.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 7.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 7.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 7.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 7.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.15
shipping, due to weight, counts as 1st item

$ 7.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.20 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Not entirely true. The MC1377P that is used for the RBG analog has a
composite output pin, and the circuit can also be easily modified for
Y/C output as well. Check out the ST's schematics, or better yet, look
at the Jag schematics to implement Y/C on an ST. The RF modulator is
not necessary.
Mike

I am fairly new to all of this and thinking of getting an Atari St to produce my own music and would like some suggestions as to the best package to get for this - using Midi.

Or should I not even be thinking of Atari. It was a friends suggestion.

Any guidance appreciated.

the best person to talk to on this is Tim Conrardy, who posts to this forum. His Atari MIDI pages will have the answers you need, and not only that, some cool freeware sequencers, MIDI utilities and patch librarians (many of which were commercial products at one point, especially the Dr. T's stuff) for you to download and use.

FWIW, when I was using my STe for music the best sequencer I ever used was Notator SL 3.1 !

"A" does not mean floppy drive A: here. The setup above maps the CD-ROM
drive to drive X:, not to floppy A:.

The RF modulator is not necessary, but it was my understanding that Atari did not bother to implement the circuitry needed to bring the composite signal out from the video chip unless there WAS an RF modulator installed.

That is, it might be possible to kludge something together, but it would have to be a hardware hack to get the signal into a form that could be used to interface to anything usable.

3020. Ghostscript printing?

Newsgroup: comp.sys.atari.st
Date: 2001-08-22 12:41:58 UTC
From: nozpam@zonnet.nl
Message-ID: <qMNg7.33964$Vs4.344732@zonnet-reader-1>
Source record: 42493

I'm trying the Ghostscript version GEMGS.GTP 1.3 from Christian Felsch.
(based on Alladin Ghostscript 6.01)
I can view PS and PDF files on my screen, but until now I have
not been able to print anything with my printer or to a file (IMG or
other format). I have no idea what I am doing wrong. Can anyone help
me print a page succesfully?

I'm using a 14MB Falcon030, but the GEMGS030.GTP version doesn't work. Do I need
an FPU and/or TT Ram for this version? The docs say it's a TT version.

Under Magic (Atari) I've used Nembench, Dspbench and DSPMIPS
(states for the Falcon) by Doug @ BSS. E-mail me if you want!

>Any guidance appreciated.

Hello,

If you want to produce your own music by writing notes I would recommend Score Perfect Professional 3.2 for Atari. This is IMO one of the most perfect note editors ever made. Set the notes on score by mouse clicks, print perfect scores and play the scores via a sound module. (Midi GM) Many options. Works perfectly on any Atari. I use it since years on a 4 mb 1040 STE, on a Milan and on my Falcons.

Cheers
Dan

: other format). I have no idea what I am doing wrong. Can anyone help
: me print a page succesfully?

Maybe. There are a few things that I never did get to work, and one of
them was resolutions greater than 360 dpi to an Epson color inkjet
printer, which will do 720 dpi. What printer are you using, and what
resolution are you using? Try a lower resolution, for a start.

: I'm using a 14MB Falcon030, but the GEMGS030.GTP version doesn't work.
: Do I need an FPU and/or TT Ram for this version? The docs say it's a
: TT version.

No information. I use a TT, and it works on a TT. As I vaguely remember
gcc compiler settings, you need a FPU. If you have one, I do not know
what else could be wrong.

3025. Megafile 60 Help !

Newsgroup: comp.sys.atari.st
Date: 2001-08-22 16:52:03 UTC
From: ZX_SINCLAIR <cerelli@interfree.it>
Message-ID: <9m0om9$2lj$1@serv1.albacom.net>
Source record: 42396

Hi my name is Marco and i have a problem with an
ATARI 1040STf and his hard drive the MEGAFILE 60.

The problem is that i cold not use the HD.
When i first switch on the unit connected with the ST the only thingh i can
see
was about 8 or 10 bombs on the screen and then reboot ...bombs..reboot

I have formated the HD with the AHDI with success next i have patitioned
it
(a single partition of 62 mb)
So i have tryed to install it with the installer supplied with the AHDI but
afer a short work
he shows two little bombs and return to the desktop....(what's happen ?)
A little thing ....the AHDI utlity did not recognize the unit as megafile 60
so i have to choose "other" in the menu that show the tipe of unit i want to
operate(SH204 and so on) ....but he format it (it takes a long time showing
a progress bar...)

How can i operate on the hd now ???
It doesn't boot and if i start the atari with a floppy on the desktop i
can't see the hd
icon. If i try to install the unit with the item "install disk drive" on the
menu bar it create the icon
but is not possible accessing the drive ..the atari respond somthenig like
volume unit wrong or not accessible....

Can someone help me ???
I hope so !
Thanks ...and sorry for my bad english.....

Marco

Let me say it really works slow but good.

1) load page
2) go to 'optionen': select the right printerdriver in 'ausgabegerï¿½t
select the right paperformat
select the right solution

3) Go to menu 'Datei/ausgabe'
select 'Ausgabe auf Drucker (PRN)
DON'T click on 'start' but on 'abbruch'

4) In Optione click on reload page and there you go.

For each page however you need to give GS the command to print.

3027. DevPac 3.10 and Hades

Newsgroup: comp.sys.atari.st
Date: 2001-08-22 20:29:38 UTC
From: Olivier VANONI <ovanoni@icor.fr>
Message-ID: <WS3.141eb1ba.87665ac2.ovanoni@icor.fr>
Source record: 42414

Hello.
I can't use the debugger of DevPac 3.10 on my Hades 60. Each time I launch
it from the shell I have a message "This is not a 680x0 processor,
don't try to load any program". Then I can only reboot.
The editor is Ok and I suppose the assembler too.
I used another debugger to follow the execution of AMON.PRG, and found
that this error is due to the value at $59E _longframe.
It indicates if the processor use short or long stack frames.
And AMON doesn't like the long stack frame of the 68060.
It tried to modify this value but all I get is a crash just after the value
is set at 0 (short stack frame).
Is there something to do or DevPac can run only on previous processor until
68040.
In this case is there a soft that can do as DevPac but can run on a 68060 ?

Thanks in advance.

3028. Wanted Mega STe, box only.

Newsgroup: comp.sys.atari.st

Source record: 42399

I suppose this is the best place of any to find out if someone out there has a Mega STe for sale (looks like a TT but isn't). Doesn't have to work completely or include drive. I have almost all the parts to repair any STe and the ability to produce my own TOS or PAL chips. I might also consider a TT, but don't have schematics yet. I've already spent plenty to relive my atari days and have almost everything except a hardrive, so I'm not in the market right now for a fully loaded Falcon, Hades, Milan, or complete systems.

I had a PAL CLAB board and it indeed had the D/A RGB converter (MC1377P) on the board, sans the RF modulator. On the PAL boards, the oscillator circuit clock is different however. It's really no kludge or hack to install the chip even if it isn't present on the board. The MC1377P, which provides RGB out, also provides the Y/C (MC1477P ?? D/A required for Y/C) or composite output, which is the signal he wants after all. The layout is there. Basically solder in the chip, and follow the instructions contained in the Motorola data sheet. Using an ST schematic I guess would help, but the motorola data sheet pretty much spells it out, and traces are easily identified with a meter. Pretty sure the Video Turtle seen advertised here is basically the same thing in an external box. Installing the chip would be a cleaner solution.

Hi Ric,
I'm well behind in my messaging, but I couldn't see a reply to this
message. Fonty by Matthew Carey could edit fonts for Calamus v1.09N.
It was commercial from the FaST Club but pretty cheap. I'm sure
someone more local to you can up with a second hand copy for you...

It was probably backed up using the "compack streamer" option. Maybe
you could drop it on STZip or LZHShell to see if anything sensible
emerges. I can't think of any other way short of using FCopy Pro
itself.

Is it a large file? Maybe someone could do the job for you?

Hi Hallvard,
Joe Connor had a shareware bundle including Stewart, JML-Snap,
McBoot, McFli and StIc but I don't think it ever got translated.

> ...looks like a very nice boot-selector at first glance. I'll have
> a closer look at it when I get the time.

McBoot was interesting because it lets you set up extra windows for
extra folders ie: MAGIC\START, a folder of ASSIGN.SYS files, or the
XTENSION folder. Very Magic (or MinT or whatever) friendly.

Hi Marco,

This sounds very similar to a problem I have with a Megafile 30 I own. The problem in my case was the drive mechanism was bad and I have to replace it (its a half height RLL type hard disk). One thing you could check (if you haven't yet) try unplugging the drive, opening the case and checking to see if all the cables are connected ok.

Allereerst,

Sorry for posting in dutch, but this HW must be collected.

Heb hier nog steeds staan een:

Atari MEGAST2
Atari Megafile60
Monitor Atari SM124

Nog een extra atari monitor in doos. (geen verdere gegevens, staat ergens achter)

Gratis af te halen door een echte liefhebber.

Af te halen in koewacht (stekene), belgie.

PS. Weg wegens plaats/tijd gebrek. Spectrum en C64/128 gerelqteerde spulletjes als eventuele ruil zijn welkom, maar dit hoeft echt niet.

Alvast bedankt.

Johan

I don't recall this as being necessary, but I've had problems with some sort
of file not found errors being reported whilst attempting to print so perhaps
this is the way round that.

>For each page however you need to give GS the command to print.
>[alt]+[n] (Nï¿½chtste seite)

How about ticking "No pause" under "Options"?

BTW there are English text and resource files for GhostScript on my web site
for any non-German readers :-)

I've found that GS seems to overwrite the file it produces when printing to a graphics format with the output of the next page. Less than useful.

I presume you know that you can change the extender to APP or PRG to have it run straight into its GEM front-end?

Very very unlogical, but it works !! Thank you. Click on "abbruch" and
"reload page"....why didn't I think of that myself ;). I hope there
will be a next version where the buttons and menus do the things you
would expect them to do.

About multiple page printing: instead of [alt]+[n] I just needed to hit [Return].

>(a single partition of 62 mb)

Try partitioning with two or three partitions, make the first one about 20MB
or so, depending on how many files you want to put on your boot partition.

3043. Motorola : transfer PowerPC in its entirety to Apple ?

Motorola moots Semicon Products Sector sell-off
By Tony Smith
Posted: 22/08/2001 at 10:17 GMT

Motorola has threatened to sell off its semiconductor unit - the division behind the PowerPC and Palm's Dragonball CPU - if the financially troubled operating can't turn itself around.

"No segment of the company is sacred in terms of being protected from its obligation to contribute to that level of financial return," Motorola investor relations chief Ed Gams told analysts this week. "There are no sacred cows here.''

"The present level of financial performance of the segment cannot be tolerated," he added. "Improvements are expected.''

And Motorola president Robert Growney said that a deadline has been set by which the company's chip division, the Semiconductor Products Sector, must show that it can start sufficiently contributing to the company's bottom line. Growney would not say how long the SPS has.

With its focus on embedded applications, particularly communications and networking products, SPS has been hit hard by the downturn in the global chip market. Sales of PowerPC chips for desktop computers, almost all of them to Apple, and Dragonball CPUs to Palm and its licensees have dipped too.

The SPS posted a $131 million operating loss in the first quarter, followed by a $381 million operating loss in Q2. However, a cost-cutting programme, including plant closures and job losses, has brought the division to break-even. Right now, it's praying for an upturn in the market to counter the significant drop on demand experienced during the first six months of the year. Even then, 2001 will see an overall decline of 15-20 per cent, the SPS reckons.

Apple may be doing less badly than other PC vendors, while Palm appears to be picking up, but even together they add up to a small percentage of Motorola's embedded sales.

But how serious is Growney's threat? Certainly, in the past, he has called the SPS a core Motorola business, and therefore safe from sale. That might suggest that his latest comments are as much about reassuring Wall Street that the company will take extreme measures to improve its financial position if it has to. It might also act as a verbal kick up the arse for senior SPS staffers.

Another option open to Motorola is to spin off the SPS, as Siemens did with Infineon, but the tone of Growney's latest and previous comments suggests as IPO isn't a choice the company is likely to pursue.

One other possibility presents itself, however. Motorola could indeed be selling off the chip business - or at least part of it. As we've reported before, Apple is believed to have the right to buy Motorola's PowerPC assets. Unsatisified with Motorola's progress in getting the PowerPC to compete more effectively with the x86 world, Apple has been putting more and more development effort into making the platform better suited to its own needs. The logical upshot of that - combined with Motorola's greater interest in the embedded market - would be to transfer PowerPC in its entirety to Apple.

Growney's comments can be read to pave the way for such a sale, which can now be presented as a streamlining of the SPS' business and as a money-making exercise both leading to profitability. At the same time, it allows Motorola to retain control over a core business: the development of chips for communcations markets.

Of course, Apple may not want to take on the PowerPC because it ties it to the platform more tightly than it is now, particularly now it has launched the potentially multi-platform Mac OS X. However, acquiring PowerPC from Motorola would put Apple in charge of its own destiny, and send a big message out to the world that it's support for the platform is undiminished.

In any case, it could buy the platform with its other PowerPC partner, IBM, set it up as a jointly-owned subsidiary, which would leave it room to manoeuvre later on should a change of platform ever become necessary.

So far, there's little to suggest an Apple takeover, but hints from one source claiming to be an Apple staffer. However, the plot's various strands do appear to be coming together, enough at least, to warrant a close watch over the coming months. Any Apple, IBM or Motorola staffers who know more can tell us all about it here. &#65533;

Uwe, where is your sig? Still, after all these years, I laugh when I
see it.

As far as the topic, isn't there a post script driver for Calamus SL?
AIRC, it is expensive, but hey, if one is still using an Atari, money
is no object! A post script driver would allow fast printing to HP
printers, and the poor souls with Epsons can upgrade. But if they are
going to bitch about having to purchase NVDI (who would use TOS
without it??????), the post script driver is likely out of the
question for them. If you can't afford the tools, you don't need to
drive the machine.

After being gone for so long, upon return, I have noticed this note of
negitivity from a couple of 3 or 4 yearold newbie CSAST users:) Guess
thats why the 8-bit'ers keep to their own:)

Grub,
Mike

Is anybody ever try one of those in a TT or MSTE :
http://www.voxtechnologies.com/vme_network_boards.htm
I don't know the price but they're based on the "lance" controler....
this could be a good alternative to the lack of VME Ethernet card on
Atari.

> no scsi support at all. I do remember seeing other similar devices.

AFAIR, the old sh204 was sometimes bought by mac users, because there was an ACSI-SCSI adapter inside, so they could hook in onto a mac with SCSI.

Megafile 30 & 60 are Shughart interface / RLL; I had to replace the drive in my megafile 30 some years ago and I can confirm: Single board, no SCSI inside.

If you are willing to take the risc, you _can_ put an MFM-drive into a megafile 30/60: It will work. The "hostadapter" will format it as RLL. But I don't know how safe your files will be...

My advice: Save the hassle, get a complete new harddisc for your ST.

Bye,
Marc

>techniques to this perplexing dilemma !

Perhaps the CT II takes up the space that I used. I found that I
could lay the drive down sideways between the power supply and
floppy drive, with a little squeezing of the cables. It lies on
top of the shielding, wrapped in thin card to prevent shorts. My
power supply has a fan mounted over the top of it and this seems
to extract the hot air from the HD as well. Of course, the central
support post for the cover screw had to be sawed off as it would
otherwise have gone straight through the drive - or rather
wouldn't - the lid would not have gone on at all! :-)

Regards, /Peter/

>not been able to print anything with my printer or to a file (IMG or
>other format). I have no idea what I am doing wrong. Can anyone help
>me print a page succesfully?

I use the same version and it prints everything that's on the screen. The order of setting things up is critical - you have to first choose the correct printer settings in 'Options' - 'Output device', 'Page format' and 'Resolution' - and then click on 'Output' in the 'File' menu. Check that the 'Output device' and 'Resolution' are correct and that the 'Output to printer' radio button is selected. If you click on 'No pause' in 'Options', GEMGS ought to print the whole document.

But I found recently that for some reason it would only display (and print) the first 14 pages of a 22-page document (all in graphics - didn't need to load any fonts) whether 'No pause' was switched on or not. Changing over to V1.2 cured that.

I also wanted several prints from the same file. If you want to do this and have enough disk space, make the settings as above but choose the 'Output to file' radio button. This wil take some time with large documents. When finished "printing", quit GEMGS, double-click the file (under TOS - with MagiC, Thing etc. make sure no application is installed to Show or Print files) and clicking on the desktop's 'Print' button in the dialog will print out the whole thing much faster than having to build up the pages repeatedly.

>I'm using a 14MB Falcon030, but the GEMGS030.GTP version doesn't work. Do I need
>an FPU and/or TT Ram for this version? The docs say it's a TT version.

Sorry, not sure. My Falcon has an FPU though no TT RAM.

The standard Bridge module, if you purchase it, will export a postscript file. But you need the Calypso or Calypso Lite modules to import a postscript file.

My Calamus knowledge gets older by the day, so I may not be exactly right. And the modules do not work with 1.09N.

Hi,

I know you're talkin' Calamus, but in case people weren't aware.... Pagestream does have a postscript driver with it. I just got a Ricoh AP2100 laser printer, and thought I wouldn't be able to use it with my Atari :-(but I saw a PS driver in Pagestream. I tried it out, and I'm able to print Pagestream documents fine. :-) The Ricoh has PCL-5e, PCL6, and Postscript compatability. Maybe some other printers don't have the PS compatability. Oh, the Ricoh AP2100 is only MONO. I know people have been talking about COLOR printing.

Hope that helps, or at least provides fuel for more discussion,

Clayton Murray
Seattle, WA USA

All true, but there is now a PS printer driver in both colour and mono versions. But IIRC there was a PS printer driver available some time ago, perhaps it was only a demo version though.

Do you think it's only Ghostscript who has troubles with PDF? Even
Acrobat reader is sometimes unable to display PDF files.

About printing. So far I never can across a pdf that couldn't be printed
out. However sometimes one has to convert pdf to ps in order to print
the whole document. One can do this with pdf2ps.ttp (part of the gemgs
package). Just drog and drop the pdf one want to convert to the ttp.
Remember pdf2ps.ttp must be in the same dir as gemgs.gtp. Once done you
will see a what_ever.ps beside what_ever.pdf. Don't trow away the pdf as
this file is still needed to print. Load what_ever.ps into gemgs.gtp and
there you go.

>How about ticking "No pause" under "Options"?

Oeps although I use gemgs quite a lot I never noticed that options.
Shame on me. Thanks.

TTFN

YEP...that would be me. Thanks to all the prgrammers you can now
download lots of great FREE midi software for your Atari with the
likes you will never find on any platform! So right now...thanks to
the internet, its a great time to use an Atari for Midi. We also have
a great forum for Atari Midi users so you can ask all the midi Q's you
want. Details on my site! There are also Atari-Midi members who use
thier Atari's for Midi and thier PC/ macs for Digital Audio making a
great hybrid.

So here is my site:

http://sites.netscape.net/timconrardy/timidi.htm

Then come join us at Atari-Midi.

Tim Conrardy

OE himself! Can't even produce a proper sig delimiter :-)

>--

Anyway, right now I not aware of any bugs in Okami, which is not bad for
such a complicated program that I use on a daily basis...

Okami in contrary to OE is capable of producing non-wrapped long html
links and can put citation marks even if you follow up to a post in QP
encoding. Just to mention a few of the OE problems.

Maybe a 100 new registrations or so (not likely, perhaps) would
encouarge(sp?) Jos den Becker to continue his excellent work...

This story goes only for the pc version of OE. The Mac version produce a
proper sig. separator
>
>Anyway, right now I not aware of any bugs in Okami, which is not bad for
>such a complicated program that I use on a daily basis...

Hmm, there are a few problems left. For instance, Okami doesn't like
Memory protection very much.

>Okami in contrary to OE is capable of producing non-wrapped long html

I have a Mac next to me. I've tried quite a few Mac mail clients. None
of then come close to Okami.

According to some well informed people on the Yahoo Atari-midi
mailinglist there is indeed a v. 4 of SPP out for Atari too! The web-page
only talked about 4 for Win and 3.2 for Atari last time I checked it.

3066. Falcon CT2B IDE Drives

Newsgroup: comp.sys.atari.st
Date: 2001-08-24 22:34:28 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <9m6kpk$jo4$1@newsg3.svr.pol.co.uk>
Source record: 42436

Just a short one!

Who uses a CT2B Falcon with a 10Gb or more IDE Hard Drive?

What Hard-drive driver do you use?

Does anyone have a 20 Gb Seagate ST320413A working on their system with HD Driver 8.03 or any other version of the software?
I have one but cannot get it to work with HD Driver, HDDRIVER.PRG crashes and therefore I can't get the Seagate partitioned or configured!!

Help!

Thanks

Neil

For that matter, HOW do you put an IDE drive in a Falcon? Are the
2.5" mounting holes already there or does one need a bracket? If so,
what type?

Galen (who is eyeing a 6.4Gb 2.5" drive in the Tiger Direct catalog)

Itï¿½s simple to drill new holes into the ide bracked.
Newer IDE devices had different screw holes.

Other way is to put a piece of paper between drive and bracked and fix
the drive with two rubber rings.

>Perhaps that statement was worded poorly. The situation referred to is often
>called "M$ tax." Will M$ let you install a second OS along with theirs?

Microsoft's EULA only restricts how OEM's install Windows, and software "into Windows", and has no control over the rest of the product. They can't tell us not to install Linux alongside it.

in a standard falcon you saw off one of the upper case screw posts and wedge
the 3.5 in between the psu and floppy, it is a tight fit, as I don't know
where a CT II goes I can't comment

Hi,

Does anyone know if the EPSON Stylus Photo 790
can be recognized by NVDI? I've just bought the
printer for a very good price but I am not sure
if it'll work on my TT.

And if someone has got it done can he or she
tell me how?

Thanks in advance,

Raoul Teulings

>
>"A" does not mean floppy drive A: here. The setup above maps the CD-ROM
>drive to drive X:, not to floppy A:.

Thanks to both Dr Uwe and Hallvard for enlightening me, but the following
is what I am referring to:-

; EXTENDOS.CNF: configuration file for ExtenDOS Gold
*OPT C=7
*BOS, C:\GEMSYS\EXTENDOS\CD.BOS T=1024 L=128, Z:11
*DOS, C:\GEMSYS\EXTENDOS\UNIDRIVE.DOS P=24 B=40 R/O U=Y, S:Z

In other words, my CD partition is "S", the other drive is "Z" not "A".
I set it this way because "A" caused problems (in both SPIN and Extendos).
Yet I happily accept Uwe's judgement in the matter.

Charles.

3081. DACAPO TXT, HYP or HTM

Newsgroup: comp.sys.atari.st
Date: 2001-08-25 18:37:32 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <9m8r9c$e4h$1@thorium.cix.co.uk>
Source record: 42352

Hi!

Does anyone have one of these instruction files in English or German please? I believe there was at least a German HYP.

I have a registered version of the 1.22a program but it came with no instructions :-(Although it is fairly intuitive to use, I am sure there are some things in it that are not obvious.

Also, anyone know how it compares with ADDRESS? What are the relative advantages/disadvantages of the two? It seems to me that DACAPO has an easier to read screen display with more info visible directly in the list without having to open the 'card'. OTOH it seems quicker and easier to dial directly from ADDRESS since you can do it from the list - with DACAPO you have to open the card and then click on 'Dial'. Against that is the fact that there is not really enough room for the current length of web page addresses in ADDRESS whereas the extra lines in DACAPO can be used for this.

Any experience from users welcome!

Thanks!

Regards, /Peter/

>According to some well informed people on the Yahoo Atari-midi
>mailinglist there is indeed a v. 4 of SPP out for Atari too!

According to my SPP dealer in Holland the developpment
definitely stops at 3.2 for Atari. The version 4 is available now
for Win and soon for Mac's. I was also told that in the near future
SPP is going to be overhauled, the author is going to change the
programming language.
Despite this sad news, fortunately version 3.2 is already at a
high point of perfection.

Cheers
Dan

Cort --

Once you get your Syquest system back up and running, I have two Syquest 270MB (SQ3270) cartridges that were left over and never used (one is still in its original shrink wrap packaging, the second has been opened and formatted, but otherwise never used - I sold my 270MB drive mechanism and have these two cartridges left over). If you can use them, you can have them for $10 each plus shipping. Email back if you're interested.

: Atari.

I think I can say without doubt that they won't work out of the box, but since there have been several LANCE based boards for the Atari, a driver should be rather easily adapted.
Both the Riebl and the TUWTCP card are LANCE based.

Mind you, these seem to be made for industrial clients and as a consequence might be quite expensive, perhaps more so than Mario Becroft's graphics/ethernet card.

That was my point. I didn't think they could work directly but as there
is already some ethernet card for Atari based on the Lance controler it
should not be too hard to adpat those one (I don't say it's an easy task
but it's probably posible to do it)

> Mind you, these seem to be made for industrial clients and as a
> consequence might be quite expensive, perhaps more so than Mario
> Becroft's graphics/ethernet card.
>

I know but Mario don't know if he will have more time to spend on the
card (I had a short discution with him by email), so I was looking for an
alternative solution (not for me as I have a Falcon with the parallel
port adapter and I'll have an Eclipse probably next week) for people that
want to connect a MegaSTE or a TT in their existing network. I sent some
emails to some company doing VME Ethernet card and I'm waiting for some
answer. I already receive one from another company than the one I
mentioned in my first post and they are realy expensive, so I'm waiting
for more quote that I will post in this newsgroup if the price is interesting
(between $100 and $200 seems a good price as the ethernet car for
Atari computers are not produced anymore).

I would be happy if we could use ppc g4 or Athlon/Duron cpu for a new Atari.
At home I use Amd Duron 600mhz overclocked to 1030mhz. It cost me all $500
(20gb 7200hd, 256pc 133 ram, geforce2 video card, etc...) 2 months ago.
Recently Abit kt133 motherboard with duron 600 sold on ebay for $79 !
Thats exactly what I'm using at home ! Right now on Ebay Intel PIII 1ghz sells for $200 US alone.
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1268020728

This Abit/duron combo (overclocked to 1030mhz) for $79 that sold a few days ago is faster than that 1ghz intel cpu alone which costs at this time $200 US !

My point is, we could have a really cheap and powerful Atari computer right at this moment. So far we have a REALLY GOOD operating system MagiC. All we now need is a good motherboard design with a good controller/drivers and fast cpu (forget coldfire or 060). I am sick of my win98 booting 1:15 min. I had 2 Falcons, 2ste's, 1stfm, 1 atari 65xe. And I was always fascinated by Atari OS. MagiC is the best OS. Very neat looking and fast. Well, I don't want to buy Falcon anymore, I need something faster than 16 mhz :) Any new Atari above 600Mhz and I'll be the first one to buy it.

Artur...

Why wait? U just have to buy MagicPC, and voila, ull have yours "new
above 600mhz Atari". Its as simple as that.. MagicPC on HDD or bios will
execute at same speed approx, no hardware to buy..

>
> 1. Is there an English version?
Yes, it is. program and printed manual in english.

> 2. Is 4.0 available for the ATARI?
Yes.

> 3. How much is it, U.S. and how do I order?
it is 148 USD including handling and shipping.

The best is to pay by VISA.
You could send me an email or a fax with the data.

As soon as the charge is processed you
will be entitled to donwload the full version.
The package will follow 1-2 weeks later.

Message-ID: <kl5i7.3110$6e1.185576@newsc.telia.net>
Source record: 42372

Hi all!

I have made Samba to work at my home LAN. From my Falcon with MagiC/MagiCNet I now can access shared folders from my Wintel machines.

The Vassilis smb_client starts with a smb prompt (within VT52) where lots of commands are listed (help or ?). Copy files, create folders etc works fine. The advantage over FTP-Server is now that I can sit with my Falcon and shuffle files around.

The parameters: \\CAROLINE\temp -N for smb_clnt.ttp makes a connection to the PC CAROLINE with temp as a shared folder at there for me.

I now that some of the MiNT-users use Samba and some few of the MagiC users do aswell, but there's really quiet here in this discussion area about this. Should be nice to hear from some of you, have you use Samba and for what tasks.

Anyway, here's a short description how I settle this up:

I do use the link2you app to attach my $HOME and /usr folders to the U-drive.
link2you.prg I placed (early) in the c:\gemsys\magic\start\ folder.
The link2u.cnf have these rows:
sln e:\usr u:\usr
sln e:\tmp u:\tmp
delu a

my e:\usr contains the subfolder home ($HOME) and the folder \local.
The samba folders is located at e:\usr\local\samba\ (subfolders \var, \lib, \private, \lib\codepages)
The smb.conf is located in the \lib folder and the Samba Client as \usr\samba\smb_clnt.ttp
The whole \usr is then re-directed to u:\usr with link2u.

Why do I re-direct the $HOME to u:\usr\home then?
Do not really know but most MiNTnet apps work well under MagiCNet and some of them have to be accessed through the u-drive, so I thought the ini-files should be there aswell. Hmm... seems odd but things works well, anyway.
With this row in the magx.cnf file I made this so:
#ENV HOME=u:\usr\home

My e-drive uses long filenames which is necessary to make MagiCNet works well. I have my \etc folder at there with all the Ethernet necessary files. e:\etc is also re-directed to u:\etc but not with link2u, 'course MagiCNet do the job with parameters from the MAGX_RC.NET file (variable etc_path that pinpoints my e:\etc)

In what way Neon is itchy... I have no troubles at all with it here..
Im not using Magic, still Neon should run well in single mode, and i have
no NVDI related troubles at all.. I got it running in MiNT as well and
there are no troubles as well... seems odd

Hm, comp.sys.atari.announce _does_ seem to be dead at the moment. Last message was posted 7/5 by the moderator.

I did try to post sometimes later and so did Eric Hï¿½ll (MyMail author) but unfortunately at least my ISP can't be used to post to moderated newsgroups. My ADSL ISP has a very poor news service.

>

cheap compared to some pc/mac dtp software but not really so good. As I've stated more than once the printer drives have been buggy for years and don't support the bulk of the current printers available. This is a fundamental flaw in calamus. A dtp program that can't reliably produce printed output on printers available *now* isn't worth the time of day.

Thats sheer utter nonsense. These are fonts I got licenced with my copy of calamus long before Invers got their hands on it. The fact that a commercially available font that I PAID for (ie not free or shareware) is incomplete is totally inexcusable.

I've done a similar thing by printing postscript to disk and printing it
on the lasers at college. Thas one really good feature I like with the
pagestream drivers. the ability to produce files to different devices,
not to the printer port only.

Puzzling..... but :
I have just mailed Christof Schardt and asked him to clear up the
contradicting statements of him and my SPP dealer about the
status of SPP for Atari.
In the meantime I am waiting for my update from the Atari version
3.1 to 3.2 and the update from 3.2 to 4.0 for Windows which I
recently ordered.
I'll keep you informed.

Cheers
Dan

The problem in this case is not that there is no modulator, it is that
when there is no modulator, Atari did not bother to install the rest
of the circuitry that provides a composite video signal to the
modulator (and to the external world, which is what the original
question was asking about).

The presence or absence of an RF modulator is just an easy indication
of whether or not there is a composite video signal available at the
normal RGB jack.

3117. NVDI and AtariWorks

Newsgroup: comp.sys.atari.st
Date: 2001-08-27 15:35:06 UTC
From: jba4@po.cwru.edu
Message-ID: <3b8a6787.5252787@news.cwru.edu>
Source record: 42389

Hey everyone! I recently purchased NVDI for my TT. I am using an Atari SLM804 printer on my system. Anyway, my wordprocessor is AtariWorks and I'm trying to print using NVDI. The laser printer is set up as my default. When I print, the TT completely halts. So I went ahead and changed the atari laser printer to unit 21 in ASSIGN.SYS to try and fix the problem. This didn't work either. Does anyone have any ideas about this?

If there isn't a fix, which I'm guessing there isn't, are there any other english modern word processors for the Atari? I can't use Papyrus under my setup for some reason, it just halts the system. And I don't like the idea of their online manual system.

Thanks for any help!

If he needs RF-Out, but the Digital to Analog converter will still
have to be present on the motherboard. If one looks at the Motorola
data sheets, you can see that fitting the MC1377P is a jr school
electronics project, it really is that easy! I have enough of the
D/A's, small cases and oscillators to build about 15 SVHS converters.
A few years ago, I asked for interest in a converter like this for the
Falcon and ST, but only a few replied. The parts are cheap, but the
time to assemble wasn't worth the response. The guy that pushed the
Video-Turtle in this group I think found that out. Build a decent
device for the ST, and no one will let go pennies for it. Same as with
software. Why should someone take a year of their free time to
develope an applicaiton, when all would want it for pennies??????
When was the last time someone paid the shareware for STiK? Without
that, more than half of the TOS internet users would be SOL. Atari
users can either be happy with what they have instead of posted these
stupid "lets get a new company to build us $300.00 Falcons that are
faster than T-Birds at 1ghz....get real.
It's a fun box. Just don't expect your programming neighbor or
hardware builder in the TOS world to have much sympathy. If you get
pointed in the right direction, with the confidence that someone else
had sucessfully managed to run the code you want, or modify that
hardware for a specific purpose, then your ahead in the world of Atari
now of days.

Hei Jeff.
I also use NVDI5 and Atariworks and Papyrus4 with a HPDJ600. Check that your configuration in the cpx has a cache settings over 250k or 512k. For Papyrus check your allocated menory and
printing cache are enough, adjust accordinly and save all setting always.

regards.

You are talking about which version of Calamus?

>As I've stated
>more than once the printer drives have been buggy for years and don't support the
>bulk of the current printers available. This is a fundamental flaw in calamus.

Again, that's not a fundamental flaw of Calamus. It's just a commercial
necessity. As a commercial company Invers can't bother anymore to write
Atari printer drivers. In fact you should blame Behme and Behme (NVDI)
for these buggy printer drivers and not Invers. We must be very dankfull
because Invers still support our platform more of the less. We can't say
the same of the NVDI brothers.

>dtp program that can't reliably produce printed output on printers available *now*
>isn't worth the time of day.

What do you call reliable output? Futhermore thanks to the Behme
brothers none of the modern printers can't be used to it's full extend
on the Atari.

I don't know why your fonts are incomplete but mine (CG Times + CG
Triumvirate) are certainly complete. The same for the Times and Swiss
fonts that came with my SL copy.

3122. Postscript driver for LOGIC?

Newsgroup: comp.sys.atari.st
Date: 2001-08-27 20:10:10 UTC
From: claytone@foxinternet.com
Message-ID: <3b8aa922$1_1@news.foxinternet.com>
Source record: 42394

Hi all-

Does anyone know if there is a Postscript driver for Emagic's LOGIC? I have LOGIC 2.5, and I haven't seen anything that looks like it would be a Postscript driver. Pagestream does have a Postscript driver, so I was hoping that maybe LOGIC would, too. Maybe I hope too much??

Thanks,

There just has to be a fix. I have a TT, an SLM804, NVDI, and use
WordPlus as my typing program, and have no mysterious problems.

Maybe that is because I had NVDI before I got an SLM804. If all else
fails, reload NVDI.

This really depend on what you want to do. I have made quite a few CD booklets using the old 1.09 with success. At home I only need to make draft printouts where quality is not a major concern.

Formerly the booklets were printed at a place where they could use the .CDK file direkt using Atari hardware.

Unfortunately we had to switch to a very modern all digital (with Mac's) printing company located 500 km away. I solved this by letting Calamus produce .IMG files at 600 dpi (yes, it worked because of the small format). There where indeed some problems with this "printer driver" working in high resolutions, but after some minor alteration to the layout everything looked OK. I then transformed the .IMG files to .TIF and mailed them to the printing company page by page.

The printed result was simply perfect (at least without a strong magnifying glass). I'm just about to try the new Calamus Light hoping to be able to raise the .TIF resolution to 1200 dpi. This would make the final result even better.

Some of the booklets can be read (in html format converted from .CTX files) at http://www8.tripnet.se/~sb/mr/

I have a TT, Papyrus 5, an SLM804, NVDI, and run Geneva with Neodesk. I
can print just fine with this setup.

Which version of Papyrus are you using?

Could the problem be that the SLM804 uses the DMA port and you
have not set up your TT for background DMA? In any case, does NVDI
support DMA printing? And have you set up the Diablo emulation?

>Papyrus under my setup for some reason, it just halts the system.

Could be for the same reason.

>And
>I don't like the idea of their online manual system.

Agree with you there - it's nearly as bad as people using HTML
help-systems. ST-Guide (or 1st-Guide) are *much* easier and
particularly faster, even though they don't allow fancy fonts.

Of course you can always print out the PAP help-text!

3129. Cubase Audio Noise Problem - SOLVED!!!

Newsgroup: comp.sys.atari.st
Date: 2001-08-28 05:08:18 UTC
From: nurmix@spam-free.com
Message-ID: <3b8b240c.1577963@news-server.socal.rr.com>
Source record: 42301

Well, thanks to a reader of the group (who doesn't post), I've found a way to deal with the [random POPS and CLICKS] noise problems I've experienced in Cubase Audio.

Wayne Martz is his name by the way - a genius in my book!
;-)

Anyway, he sent me a most helpful e-mail after reading about my CAF problems here. He informed me that when a POP or CLICK rears it's ugly head, simply quit CAF, and do a quick defrag of the partition (by the way, he and I both use Diamond Edge for this). Upon reloading the song, the noises will not be there.

I had never thought of doing this, but he said it occured to him after he had some noises, and he looked at the waveform, and couldn't see any VISUAL sign of the noise. Whenever I had a noise show up, I'd grumble angrily, and re-record the track. * Note: This gets old very quickly with vocalists!

So, I did some testing tonight, and when a noise showed up, I did what he said, and when I played the track back, the noise was GONE.

And now that I know this method works, I can safely record tracks, and when a noise "pops" up, I can safely IGNORE it (and reassure the vocalist that everything is ok!) and continue recording - knowing that a defrag will clear things up after the session.

A simple, elegant fix. Thanks again Wayne!

This list was last updated on 08/28/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 3.00 Art & Film Director (Epyx) -- $5.20 shipping, due to
weight, counts as 1st item
$ 3.00 Death Sword (Epyx)
$ 3.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 3.00 Final Assault (Epyx)
$ 3.00 GFL Championship Football (Gamestar)
$ 3.00 Keith Van Eron's Pro Soccer (Microplay)
$ 3.00 Lands of Havoc (Antic Software)
$ 3.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 3.00 Quadralien (Spinnaker)
$ 3.00 Renegade (Taito)
$ 3.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)

$ 3.00 Warship (Strategic Simulations, Inc.)
$ 3.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 3.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 3.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 3.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 3.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 7.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.20 shipping, due to weight, counts as 1st item

$ 7.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 7.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 7.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 7.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 7.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 7.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.20
shipping, due to weight, counts as 1st item

$ 7.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in (please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Jeff doesn't say whether the printer worked before installing NVDI5, but I'm assuming that it did. I can't see any reason therefore why it doesn't work now. The Diablo emulator is only for use as a "default" driver if there is no other specific driver available so is used for text dumps from the Desktop for example. A very few progs used routines in the emulator for graphics output, but NVDI isn't one of those AFAIR.

If the printer's never worked, then it's possible that there is insufficient ST RAM available - the Atari laser printers need at least 1 and preferably 2MB to work properly.

Maybe some judicious twiddling of the Run and Malloc in TTRAM flags is needed??

I assume that the clicks etc are due to CAF muting output whilst the disk
drive finds the next sector for the file being read.

BTW, I know next to nothing about recording audio on our platform, but I'd
probably want to make sure that I was using an AV-rated drive. These don't
recalibrate themselves whilst you're recording.

Don't use Diamond Edge on LFN partitions.

3134. Re: NVDI and AtariWorks

Newsgroup: comp.sys.atari.st
Date: 2001-08-28 13:02:43 UTC
From: jba4@po.cwru.edu
Message-ID: <3b8b956e.2293211@news.cwru.edu>
Source record: 42304

I think when I posted my problem, I didn;'t give enough detail about what happens. I do appreciate all the suggestions so far and I have tried most of them to no avail.

When I'm using AtariWorks, I go to the ile menu and select "Print..." This causes some hard disk noise and the busy light on the SLM804 controller blinks twice. Then a bus error occurs, crashing AtariWorks. So I'm not sure that the size of the caches would be the problem since I can't even get to the print dialog.

I do beleive that the Diablo emulator might be loaded, but I'm not sure. THis might cause problems. I want to point out, though, that other programs using NVDI, such as Kandinsky and GEMGraph, can print under my setup.

I'm really at a loss here. I do appreciate all the help so far!
Thanks, everyone!

>
>
> ---
> Martin Doering

Hi martin

Pulsar is an ANALOG SEQUENCER emulator. Basically you have 3 rows of 16 notes. Each row can go forward, backward, both or random. There is also real time transposition using the 10 key pad. Its a real cool midi program.You can get some nice Tangerine Dream type stuff cook'in. The beta has the addition of a control row, which means you can add things like panning and modulation.

Hope this answers your Question.

For some reason, Netscape.net is having problems lately, so it is hard to access my site. I might move the site soon anyway.

Tim Conrardy

It's OK, the english registered version is available, you have
to donwload the demo version and update it whith the full version.

The whole documentation is also available (34 pages A5), in papyrus
and rtf format.

enjoy!

>In the meantime I am waiting for my update from the Atari version
>3.1 to 3.2 and the update from 3.2 to 4.0 for Windows which I
>recently ordered.
>I'll keep you informed.

cmassey@gate.net (Charles Massey) has confirmed on the Yahoo MIDI-list
that he now indeed has got Score Perfect 4.0 for _Atari_. Both program
and manual is in English and with lots of new features. Quoting his post:

>I see you are using Newsie and CAB. But, can you confirm that you are
>actually using SPP 4.0 Atari version?

Yep. It is 4.0 with tons of new features. The manual has a 25 page
addition just for the new features.

REDO/UNDO
automatic save
64 staves possible
scalable printout (zoom function) This is really nice!!
direct editing of polyphonic staves
combine more thatn two melodies in a single staff]
easy swapping and moving staves
hide and unhide staves
join voices
separate voices (split chords)
more formating options
ossia-parts (create for piano accopmp)
ten staff sizes
dotted tuplets
improved irregular divisions (tuplets)
drum map .... this is handy
ties between rests
and much much more.....

And he did buy it using his credit card!

So, anyone who is into serious musical notation on the Atari really
should buy/upgrade to the latest SPP. He first got the program via email
and then the manual via regular mail. I suppose this means it should be

simple to get it shipped to anywhere in the world.

Rumours said that there would not be any new Atari versions any more but this time were proven to be wrong. If enough buyers turn up for this new package maybe the development will continue?

I think only Magic 6.1 supports FAT32 and the latest english
conversion was 6.01 IIRC. Indeed, TOS will not work with them. I
seem to remember trying to do FAT32 with Magic 6.01 and I partitioned
it fine with HDDriver but Magic didn't pick it up.

Watch the monitor during boot up. It will tell you if the emulator does
not load and if the SLM is not found. I don't know about AtariWorks,
but you do not need the emulator for Papyrus and NVDI. NVDI has it's
own SLM driver.

I have a mate with the 520 STFM with single sided internal drive.

I have an external drive and remember seeing someone install
a switch to allow the ST to boot from the external DD drive.

Does anyone have any instructions for this mod?

Thanks,

baz

3150. Misc ST SW+HW FS

Newsgroup: comp.sys.atari.st
Date: 2001-08-30 12:06:48 UTC
From: fmhcom@operamail.com
Message-ID: <s%pj7.68$L31.61697@newsfeed.slurp.net>
Source record: 42322

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

---
60 Meg SCSI external drive in a nice 9.5" x 9.5" x 2.75" case.
Has 2 SCSI 1 connectors allowing passthrough.
Comes with SCSI 1 cable. $60.00

Syquest 44 drive with 1 44 Meg Cartridge and ICD Link.
Drive comes in nice shoebox style case with integraded ICD Link
allowing simple plug and play to ST, STe, and TT. Comes with one
HDX formatted 44 Meg cartridge. There is room for a second
hard drive or even a CD-ROM drive. Has a male SCSI 1 connector
cable already wired. $100.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

Bridge 4.0 by Artworx. Play the card game Bridge on your ST.
Comes with disk, docs, and box $5.00

Renegade by Mastertronic. A space shooter type of game kinda
like Star Raiders? Comes with disk and docs. $5.00

Captian Blood by InfoGrames. A Space Adventure game. Docs state
"This software explores a new concept, the BIO-GAME. The characters
can evolve, be born, die, trade information and generally get on
with their own independent lives." Comes with disk, box, and docs. $10.00

NightBreed by Ocean. This is from Clive Barker's Nightbreed story.
"Make your way through the caverns of Necropolis to the underground
city of Midian and where Nightbreed creatures dwell." "This all
action adventure allows you to shoot, punch, and jump as you
explore the terrifying underground environment of Nightbreed."
comes with disks, docs, and box. $10.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.

For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured
word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

> OE himself!

Sorry I have disappointed you, Kenneth. I work on a PC nowadays and I don't have any Ataris up and running anymore. I do have MagiC-PC installed on my PC, but I use it mainly to fix bugs in Okami. I used my own newsreader for a while on the PC, but it's simply too much work to switch OSs all the time, and I do a lot of emailing. Besides, I can't access my PC folders from within MagiC, so that, if I want to send an attachment, I always have to save the file (or a copy of it) to my MagiC partition. Computers are supposed to be a help, not a nuisance. So, yes, I abandoned my own program. But don't think for a minute I don't miss it every day!

I've been porting the program to MSDOS/WIN32 lately, and that is more or less finished as far as the basic MSDOS part concerns. I still have to begin writing the Windows interface, though, and that will be the bulk of the work.

Meanwhile, I can show you that it works by posting this with the ported version of Okami. The name of the program has changed into "Seni", and I have rewritten a great part of the core code. But you should get a correct sig delimiter now. :)

> Maybe a 100 new registrations or so (not likely, perhaps) would
> encouarge(sp?) Jos den Becker to continue his excellent work...

Maybe. But be realistisc. There are not more than a handful users now. :)

Totally agree there Kenneth, I think all in all Okami is my favourite news and mail reader bar none. Having said that, the missing lumps of hair pulled out trying to set it up in the first place was quite a painful experience - but well worth the effort. :-)

I have switched platforms now and find that I miss using Okami probably more than any other Atari piece of software.

Best of luck to Jos for the future.

Best Wishes
Sean

Hi Bob-

I haven't checked to see if these are what you're looking for, or
if they are still valid, but give 'em a try. I do remember
finding a wealth of info on connectors at one time. If these
fail, maybe try a search. "computer, connector" might get you
some good results.

http://margo.student.utwente.nl/stefan/hwb/menu_Connector.html

>with this, reporting read errors. That's probably where the disk
>protection is or something.

When I remember the good ol' days with my 1040STF back in the early 80s - now I own a Falcon030 - I had the same problem with some games. I didn't like to use the original disks every time to be sure I have at least one working copy left.

The solution was not very far away - I had a friend owning an Amiga 1000, living in the same street. ;-)

With this machine, I was able to copy *every* copy protected Atari disk, even with the most curious copy protection.

I think it's because of the very different way an Amiga handles disks. The Amiga doesn't have the same floppy controller the Atari has - I'm not really sure *if* it has a floppy controller; I think this was not handled by a specialized chip but by some other ones or a combination of chips.

Try to copy Your disk on an Amiga, if You are able to find one.

Ciao, Eick

Please use the enclosed email link within this post rather than your reply button, email not properly addressed may not be able to be responded to.

Last Updated 8/30/2001
- Sold/Traded Items Removed

I have a limited amount of brand new (sealed) Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping. Overseas shipping is available.

Due to all the game titles being in short supply, all titles with the exception of CyberMorph are available only with the purchase of a Jaguar game system.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NO.SPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NO.SPAM. first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Team Tap (4 Player adapter) $20 - (Limited Supplies)
- Jaguar unit alone (No power supply, controller or accessories) $20
- Composite Video Cable $10
- Spare Controller $15 (Limited Supplies)
- AC Power Supply $10 (Limited Supplies)
- RF Switch Box $5 (Limited Supplies)

** Atari Jaguar Games - New/Shrink-wrapped**
==========
Due to all the game titles being in short supply, all titles with the exception of CyberMorph are available only with the purchase of a Jaguar

game system.
- Checkered Flag $15
- CyberMorph $5 (No Box)
- Kasumi Ninja $30
- Tempest 2000 $40
- Troy Aikman Football $30
- Wolfenstein 3D $30

Atari Force Comics Please make an offer

Yup, thanks for the correction, Peter.
However, there was one font editor for Calamus, wasn't there? Quite
pricey at the time IIRC, but someone may have it spare.

Hi Jim,
Wordplus isn't a good example - it doesn't use GDOS/NVDI to print. It
has its own printer drivers...

3162. WTD: upgraded 1040STe

Newsgroup: comp.sys.atari.st
Date: 2001-08-31 01:31:05 UTC
From: ag352@chebucto.ns.ca
Message-ID: <9mmpcpbof1@News.Dal.Ca>
Source record: 42332

Mine is in rough shape. Had it upgraded to 4 megs, then later installed the ICD AdSpeed 16mHz board in it as well. But when a big can light falls on your computer, you expect things to die in there. Argh. My main music machine. Yes, I was given an old Mega and can run Notator SL on that, but TOS 1.02 at 8mHz annoys me now.

Anybody got a 1040Ste in their closet? particularly one with a socketed 68000 chip? I can swap in my ICD board in that case. I remember paying oodles to a techie to solder in the 68-pin PLCC socket....

PRESTO released as Shareware. Presto page completed.

For those of you in the dark, a fantastic MIDI composition package by
Dr Guerino Mazzola has just been
released as shareware. I have been working on the page which has
screen
shots and lots of info about it.

Finally got it done. Plan to do a tutorial sometime, but for
now...this is
enough info as well as full docs and also the Prestino slide show
tutorial
available in the english docs zip. Looks like a very cool Composition
package. Definatly worth looking into. You will only find this on the
Atari
platform!!Makes it worth keeping the ol' ST!

The shareware fee is only &10.00 in american money. Support Atari
programmers and send it in!Details on the page.

http://sites.netscape.net/timconrardy/presto.htm

BTW: please let me know if you can get to the page as I have been
having
problems lately accessing my site (netscape.net problem)

3165. Hard disk troube

Newsgroup: comp.sys.atari.st
Date: 2001-08-31 06:09:27 UTC
From: Oliver Graf <oliver@knusperkopf.de>
Message-ID: <1354864.fEyVGOHjE0@knusperkopf.de>
Source record: 42336

Hi there,
I bought a new, larger hard disk for my Mega ST 4: I removed the
Quantum LP 52 S from my ddd Microdisk and replaced it by an
LPS 540 Lightning. The new drive formatted and partitioned well
(C is now 100 MB, D is 440 MB). After doing that, I attached
the old drive an copied its files to the new one. That worked, too.
Now my problem: When accessing the new drive, the ST crashes
irregularly after approx. 15 minutes throwin three or four bombs.
Even when I want to see the info about C or D on the desktop
the machine crashes with three bombs. Sometimes it doesn't
boot from the hard disk. It doesn't recognize the DMA device
or it hangs during initialization (green LED is on constantly).
When I attach the 52 MB drive additionally it boots but still
crashes sometimes. What's wrong? Same happens with an
LPS 240.

> that, if I want to send an attachment, I always have to save the file (or a
> copy of it) to my MagiC partition.

Well, a few notes here. First it's a bad practice to use a single C:
partition even on the PC. A possible disk crash will destroy everything.
So, if repartitioning is not possible you can always install a second
hard disk which will be visible by MagiC_PC from the root to the whole
directory tree.

You can even make MagiC_PC to boot from C:\ instead of "Program Files\
MAGIC_PC\MAGIC_C" or whatever your installation path, this way you'll
be able to access all files/folders of the C:\ drive (even \WINDOWS :-)
Just copy Magic_pc.os, magic_pc.ini, nvdi_pc.dll to C:\, plus your
AUTO, GEMSYS, CPX etc folders so that your C:\ dir looks like a
'normal' ATARI C:\ boot partition.

Of course you could also use any removable medium to keep files that
you want to share between MagiC and window$.

Even if all the above is not possible, use the Pause! entry of the
MagiC PC menu to freeze MagiC and work in window$ as if MagiC was
not loaded (copy from a folder to your MagiC_C drive). This way
you'll not have to quit and restart MagiC and you'll not realize
how slow your PC is :-)

> Computers are supposed to be a help, not a
> nuisance.
>
True, but window$ definitely are. Then why developing for them ?

> So, yes, I abandoned my own program. But don't think for a minute I
> don't miss it every day!

Then, if the main reason is the one above, I hope now you can continue
to support it more easily.
